Jig bushes and accessories for drilling purposes – Dimensions

Guides de perçage et accessoires – Dimensions

First edition – 1977-12-**i5Teh STANDARD PREVIEW** (standards.iteh.ai)

ISO 4247:1977 https://standards.iteh.ai/catalog/standards/sist/a2ec2dac-18f8-4878-abf0-2e66ea5c6df5/iso-4247-1977

FOREWORD

ISO (the International Organization for Standardization) is a worldwide federation of national standards institutes (ISO member bodies). The work of developing International Standards is carried out through ISO technical committees. Every member body interested in a subject for which a technical committee has been set up has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work.

Draft International Standards adopted by the technical committees are circulated to the member bodies for approval before their acceptance as International Standards by the ISO Council.

International Standard ISO 4247 was developed by Technical Committee VIEW ISO/TC 29, Small tools, and was circulated to the member bodies in September 1976.

It has been approved by the member bodies of the following countries :

| | | ISO 4247:1977 |
|----------------|-------------------------|---|
| Australia | Irelandtandards iteh ai | /catalos Spaindards/sist/a2ec2dac-18f8-4878-abf0- |

| India | South Africa, Rep. o | f |

No member body expressed disapproval of the document.

Jig bushes and accessories for drilling purposes – Dimensions

| 1 SCOPE AND FIELD OF APPLICATION | 3 TOLERANCES |
|--|---|
| This International Standard specifies the dimensions of bushes to be fitted to jigs for guiding twist drills, and of accessories for use with renewable bushes. | The definitive tolerances to be used are still subject to discussion. In the meantime, for jig bushes used for general purposes, the following tolerances are recommended : |
| It deals with the following subjects : | 3.1 Tolerances for press fit bushes and liners |
| press-fit bushes, which may be either headed or | F7 on bore diameter; |
| headless; | n6 on body diameter; |
| liners, which may be either headed or headless, the dimensions of which are taken from the press-fit range | h13 on head diameter. |
| of bushes; iTeh STANDARD | 3.2 Tolerances for renewable bushes |
| renewable bushes, fixed type and slip type; (standards.i) methods of retaining renewable bushes; | F7 on bore diameter; teh.ai) m6 on body diameter; |
| - accessories (i.e. tenons, locking screws and stop 197:197 | $_{7}$ – h13 on head diameter. |
| pins). https://standards.iten.ai/catalog/standards/sis 2e66ea5c6df5/iso-424 | st/a2ec2dac-18f8-4878-abf0- 3.3. Tolerances on stop pins 47-1977 |
| NOTE – The methods of retaining bushes described in clause 6 are in general use, and member bodies will normally select one of these methods for their national standards. | Stop pins, when required, shall be supplied with a tolerance of m6. |
| If so desired, it is permitted to supply renewable bushes which can be used either as fixed type or slip type by providing the heads with the necessary features. | When this type of pin is to be used, the bush manufacturer shall provide a locating hole, with a tolerance of H7, in the head of the bush, positioned according to the dimensions shown in table 4. |
| | 3.4 Tolerance for jig-plate holes |

2 REFERENCE

ISO 4248, Jig bushes – Definitions and nomenclature.¹⁾

Press-fit bushes and liners shall be located in holes which have an H7 tolerance.

1) At present at the stage of draft.
