About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22 000 terminological entries in English and French, with equivalent terms in 16 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

67 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

ELECTRONIC DISPLAYS –

Part 2-2: Measurements of optical characteristics – Ambient performance

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62977-2-2 has been prepared by IEC technical committee 110: Electronic displays.

The text of this International Standard is based on the following documents:

FDIS	Report on voting
110/1213/FDIS	110/1232/RVD

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 62977 series, published under the general title *Electronic displays*, can be found on the IEC website.

Future standards in this series will carry the new general title as cited above. Titles of existing standards in this series will be updated at the time of the next edition.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

<https://standards.iteh.ai/catalog/standards/sist/7bbcd303-13db-40cd-810e-4d7ee29e90db/iec-62977-2-2-2020>

INTRODUCTION

This document describes the common optical measurement methods applicable in the field of electronic display devices, which overlap with some of the parts of existing documents developed inside TC 110 (IEC 61747-6-2 [17]¹, IEC 62341-6-2 [18], IEC 61988-2-2 [19], IEC 62715-5-1 [20], IEC 62679-3-1 [21]), that describe the optical measurement methods of the individual technologies, such as LCD, OLED, PDP and others. This document on common optical measurement methods is intended to be used as the reference document in future documents and in revisions of existing documents (e.g. IEC 61747-6-2 [17], IEC 62341-6-2 [18], IEC 61988-2-2 [19], IEC 62715-5-1 [20], IEC 62679-3-1 [21]). The existing standards documents will be revised in their maintenance time and they will refer to this document to the largest extent.

All documents in IEC TC 110 that are concerned with the measurement of optical properties of electronic display devices under ambient illumination refer to a set of methods and procedures that are similar to each other, or sometimes even identical. This document is intended to identify these methods and to describe them, together with suitable precautions and diagnostics, as a reference for forthcoming documents to make the work of the involved experts more efficient and to avoid duplication of efforts.

Introduction of the common optical measurement methods (COMMs) is also related to a structure where each kind of optical measurement finds its unambiguous position for identification of similarities to other methods or for clarification of distinctions. This structural classification together with a general taxonomy is supposed to make the process of documents production easier, faster and thus more effective.

The above characteristics are summarized in Table 1. The display characteristics that are addressed in this part of IEC 62977 are indicated by a check mark ✓ in the table.

[IEC 62977-2-2:2020](https://standards.iteh.ai/catalog/standards/sist/7bbcd303-13db-40cd-810e-4d7ee29e90db/iec-62977-2-2-2020)

ELECTRONIC DISPLAYS –

Part 2-2: Measurements of optical characteristics – Ambient performance

1 Scope

This part of IEC 62977 specifies standard measurement conditions and measuring methods for determining the optical characteristics of electronic displays under indoor and outdoor illumination conditions. Standard illumination geometries are specified and the reflection properties of flat screens are determined under those conditions. Reference illumination levels and spectra are used to estimate the photometric and colorimetric characteristics of electronic displays under the same conditions. These methods apply to emissive, transmissive, and reflective displays, or combinations thereof, that render real 2D images on a flat screen.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms, definitions, abbreviated terms and symbols

3.1 Terms and definitions

For the purposes of this document, the terms and definitions given in IEC 60050-845 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1.1

signal pixel

smallest encoded picture element in the input image

Note 1 to entry: Signal pixel is defined as the unit of signal resolution.

3.1.2

pre-gamma average picture level

average input level of all signal pixels relative to an equivalent white pixel driven by a digital RGB input

Note 1 to entry: Unless otherwise stated, the pre-gamma average picture level (APL) will simply be referred to as average picture level in this document.

Note 2 to entry: The APL will normally be expressed as a percentage, where a full white screen at maximum drive level would be 100 % APL.

Note 3 to entry: The pre-gamma APL is also called gamma-corrected APL in IEC 62087-2 [14]. In addition, it is noted that the tone rendering curve may not have a power law function with a well-defined exponent (gamma).

3.1.3

APL loading

influence of average picture level on display performance, for example luminance

3.2 Abbreviated terms

APL	pre-gamma average picture level
CCT	correlated colour temperature
CIE	Commission Internationale de l'Éclairage (International Commission on Illumination)
CIELAB	CIE 1976 (L*a*b*) colour space
DUT	device under test
EOTF	electro-optic transfer function
FWHM	full-width-at-half-maximum
ILU	integrated lighting unit (e.g. an edge-lit front guide plate)
LCD	liquid crystal display
LED	light emitting diode
LMD	light measuring device
OLED	organic light emitting diode
RGB	red, green, and blue
SDR	standard dynamic range
sRGB	standard RGB colour space defined in IEC 61966-2-1

3.3 Symbols

A list of symbols used in this document is given in Table 2.

Table 2 – Summary of symbols

Symbol	Units	Definition
E	lx	illuminance
$E(\lambda)$	$\text{W} \cdot \text{m}^{-2} \cdot \text{nm}^{-1}$	spectral irradiance
$E_{\text{dir}}(\lambda)$	$\text{W} \cdot \text{m}^{-2} \cdot \text{nm}^{-1}$	spectral irradiance from a directed light source at normal incidence
$E_{\text{CIE,dir}}(\lambda)$	$\text{W} \cdot \text{m}^{-2} \cdot \text{nm}^{-1}$	spectral irradiance of a CIE standard illuminant from a directed light source at normal incidence
$E_{\text{hemi}}(\lambda)$	$\text{W} \cdot \text{m}^{-2} \cdot \text{nm}^{-1}$	spectral irradiance from a hemispherical diffuse light source
$E_{\text{CIE,hemi}}(\lambda)$	$\text{W} \cdot \text{m}^{-2} \cdot \text{nm}^{-1}$	spectral irradiance of a CIE standard illuminant from a hemispherical diffuse light source
R_Q		luminous reflectance factor for a rendered display colour Q
$R_Q(\lambda)$		spectral reflectance factor for a rendered display colour Q
ρ_Q		luminous reflectance or diffuse reflectance for a rendered display colour Q
$\rho_Q(\lambda)$		spectral reflectance for a rendered display colour Q
L_Q	$\text{cd} \cdot \text{m}^{-2}$	darkroom luminance for a rendered display colour Q
$L_Q(\lambda)$	$\text{W} \cdot \text{sr}^{-1} \cdot \text{m}^{-2} \cdot \text{nm}^{-1}$	darkroom spectral radiance for a rendered display colour Q
$L_{Q\text{-amb}}(\lambda)$	$\text{W} \cdot \text{sr}^{-1} \cdot \text{m}^{-2} \cdot \text{nm}^{-1}$	ambient spectral radiance, including reflected and darkroom emitted light, for a rendered display colour Q
$L_{\text{Ref}}(\lambda)$	$\text{W} \cdot \text{sr}^{-1} \cdot \text{m}^{-2} \cdot \text{nm}^{-1}$	reflected spectral radiance when the reflection coefficients are independent of the rendered display colour Q
$X_Q, Y_Q, \text{ and } Z_Q$	$\text{cd} \cdot \text{m}^{-2}$ for Y_Q	CIE tristimulus values of the rendered display colour Q in a darkroom
$X_{Q\text{-amb}}, Y_{Q\text{-amb}}, \text{ and } Z_{Q\text{-amb}}$	$\text{cd} \cdot \text{m}^{-2}$ for $Y_{Q\text{-amb}}$	equivalent CIE tristimulus values, including reflected and darkroom emitted light, for a rendered display colour Q
x_Q, y_Q		CIE 1931 chromaticity coordinates of the rendered display colour Q in a darkroom
$x_{Q\text{-amb}}, y_{Q\text{-amb}}$		equivalent CIE 1931 chromaticity coordinates, including reflected and darkroom emitted light, for a rendered display colour Q

4 Standard measuring conditions

4.1 Standard measuring environmental conditions

Measurements shall be carried out under the following standard environmental conditions:

- temperature: $25\text{ °C} \pm 3\text{ °C}$,
- relative humidity: 25 % to 85 %,
- atmospheric pressure: 86 kPa to 106 kPa.

When different environmental conditions are used, they shall be noted in the report.

4.2 Viewing direction and light source coordinate system

The viewing direction is the direction under which the observer looks at the point of interest on the display under test (DUT). During the measurement, the light measuring device (LMD) simulates the observer, by aiming the LMD at the point of interest on the DUT from the viewing direction. The viewing direction is defined by two angles: the angle of inclination θ (relative to the surface normal of the DUT) and the angle of rotation ϕ (also called azimuth angle) as illustrated in Figure 1. Although the azimuth angle is measured in the counter-clockwise direction, it is related to the directions on a clock face as follows: $\phi = 0^\circ$ is the 3-o'clock direction ("right"), $\phi = 90^\circ$ the 12-o'clock direction ("top"), $\phi = 180^\circ$ the 9-o'clock direction ("left") and $\phi = 270^\circ$ the 6-o'clock direction ("bottom"). The same coordinate system can be used to specify the positioning of the light sources used to represent the ambient lighting environment.

NOTE This coordination is defined by the angle of inclination and the angle of rotation (azimuth angle) in a polar coordinate system.

Figure 1 – Representation of the viewing direction (direction of measurement) and coordinate system used for light source configuration

4.3 Standard lighting conditions

4.3.1 General

A light source is chosen to provide as broad, stable, and smooth a spectrum as possible in order to reliably measure the spectral reflectance and reflection coefficients of the display surface specific to the geometry of the light source. This document then applies the reflection coefficients to simulate the display performance under the same geometric conditions using an illuminant, that is, a model or measured light source with an illumination level and/or spectrum that could be different from the light source used in the measurement.

An illuminant can be used to represent the use of a display that is viewed indoors (e.g. office), or in direct daylight (outdoors). These environments generally contain a combination of directed and uniform hemispherical diffuse light sources. The visual performance of the display can depend on the type of illumination and measurement geometry. Subclause 4.3 specifies the detailed conditions of the light sources for reflectance measurements under otherwise darkroom conditions.

A warm-up time can be necessary. The light source signal shall remain stable to within $\pm 0,5$ % standard deviation within a single measurement, and ± 2 % for longer (>30 min) measurements.

4.3.2 Standard measuring darkroom conditions

The influence of unwanted background illumination shall be minimized, typically by illuminating the display in a darkroom. Unwanted background illumination is mainly a consideration for directed light sources, which is often solved by using light sources with spectral irradiance values that are substantially larger than the background. The darkroom spectral radiance contribution from the background illumination, that is, the measured spectral radiance reflected off the DUT, shall be not more than $1/10^{\text{th}}$ of the spectral radiance from the device black state with the illumination source on. If this condition is not satisfied, then background subtraction is required and it shall be noted in the report. In addition, if the sensitivity of the LMD is more than $1/100^{\text{th}}$ of the spectral radiance from the device black state, then the spectral radiance sensitivity limit of the LMD shall be noted in the report.

4.3.3 Standard ambient illumination

The following illumination conditions are specified for the optical measurements of displays under ambient illumination. The ambient illumination shall simulate indoor or outdoor illumination conditions. A combination of a hemispherical diffuse and directed source geometry is generally used to simulate either ambient indoor illumination or outdoor daylight illumination under a clear sky [1], [2]. Uniform hemispherical diffuse illumination will be used to simulate the background lighting in a room with the directed light source such as an occluded luminaire in a room, or the hemispherical skylight incident on the display, with the sun occluded. A directed light source in a darkroom will simulate the effect of directional illumination on a display by a luminaire in a room, or from direct sunlight.

The following reference illumination conditions shall be used to simulate indoor and outdoor display viewing environments. Additional conditions can also be used, depending on the use case.

a) Indoor room illumination conditions:

- Uniform hemispherical diffuse illumination – Use a light source closely approximating CIE Standard Illuminant A, CIE Standard Illuminant D65, or CIE Standard Illuminant D50 as defined in CIE 15. For spectral measurements, a spectrally smooth broadband light source (such as an approximation to CIE Standard Illuminant A) shall be used. A measurement of the spectral reflectance factor using a broad light source (such as Illuminant A) enables the indoor photopic and colour metrics to be calculated later for the desired reference spectra (for example CIE D65 Illuminant). The performance metrics shall be calculated using 300 lx for an indoor reading environment [3]. The actual hemispherical diffuse reflectance factor measurement can require higher illumination levels for better measurement accuracy. The results are then scaled down to the required illumination levels.
- Directional illumination – The same source spectra shall be used as with hemispherical diffuse illumination. The indoor room photopic and colour metrics shall be calculated using directional illumination of 200 lx incident on the display surface for an indoor reading environment with the display in the vertical orientation. The actual reflectance factor measurement can require higher illumination levels for better measurement accuracy. The results are then scaled down to the required illumination levels. The directed source shall be 45° above the surface normal ($\theta_s = 45^\circ$) and have an angular subtense of no more than 5° . The angular subtense is defined as the full angle span of the light source from the centre of the display's measurement area.
- Other illumination levels may be used in addition to those defined above for calculating the ambient contrast ratio under indoor illumination conditions. However, approximately 60 % of the total illuminance should be hemispherical diffuse, and 40 % directional illumination. Additional ratios of diffuse to directional illumination may also be measured.
