About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22 000 terminological entries in English and French, with equivalent terms in 16 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

67 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**COMMUNICATION NETWORKS AND SYSTEMS FOR POWER UTILITY
AUTOMATION –****Part 7-6: Guideline for definition of Basic Application Profiles (BAPs)
using IEC 61850**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

The main task of IEC technical committees is to prepare International Standards. However, a technical committee may propose the publication of a Technical Report when it has collected data of a different kind from that which is normally published as an International Standard, for example "state of the art".

International Standard IEC 61850 has been prepared IEC technical committee 57: Power systems management and associated information exchange.

The text of this Technical Report is based on the following documents:

Draft TR	Report on voting
57/1986/DTR	57/2034/RVDTR

Full information on the voting for the approval of this Technical Report can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 61850 series, published under the general title *Communication networks and systems for power utility automation*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

<https://standards.iteh.ai/catalog/standards/sist/bb06c3ec-a830-45ea-8589-da5b475e34a/iec-tr-61850-7-6-2019>

INTRODUCTION

The IEC 61850 series of standards offers a broad basis for communication networks and systems in power utility automation. Due to its broad coverage of power utility automation applications, it is up to the standard's user (utility, vendor, system integrator, etc.) to pick and choose specific options from the standard in order to meet the requirements of the intended objective. As a consequence, implementations of IEC 61850 represent specific subsets of the standard.

In the context of standards the term “profile” is commonly used to describe a subset of an entity (e.g. standard, model, rules).

Accordingly an IEC 61850 standard profile contains a selection of data models (mandatory elements), applicable communication services and relevant engineering conventions (based on the Substation Configuration Language SCL defined in IEC 61850-6) for an application function of a specific use case in the domain of power utility automation.

Depending on the scope and objective different profile types can be distinguished:

- User profile – defined subset that is valid for a specific user / organization (e.g. utility)
- Product / device profile – implemented subset in a specific vendor product /device
- Domain profile – defined subset for a specific domain and relevant use cases (e.g. monitoring of substation)
- Application / function profile – subset covering a specific application or function (e.g. substation interlocking)

These profile types target the reduction of complexity and facilitation of interoperability for their specific scope and during engineering and device / substation lifetime. In order to achieve both these goals, a properly defined profile and appropriate implementations (processes, tools, products) that support the profile are required.

COMMUNICATION NETWORKS AND SYSTEMS FOR POWER UTILITY AUTOMATION –

Part 7-6: Guideline for definition of Basic Application Profiles (BAPs) using IEC 61850

1 Scope

This part of IEC 61850, which is a technical report, is focused on building application / function profiles and specifies a methodology to define Basic Application Profiles (BAPs). These Basic Application Profiles provide a framework for interoperable interaction within or between typical substation automation functions. BAPs are intended to define a subset of features of IEC 61850 in order to facilitate interoperability in a modular way in practical applications.

It is the intention of this document to provide a common and generic way to describe the functional behaviour of a specific application function in the domain of power utility automation systems as a common denominator of various possible interpretations/implementations of using IEC 61850.

The guidelines in this document are based on the functional definitions of

- IEC 61850-5, Communication requirements for functions and device models, which gives a comprehensive overview of all application functions needed in a state-of-the-art substation automation implementation. [IEC TR 61850-7-6:2019](https://standards.iteh.ai/catalog/standards/sist/bb06c3cc-630-45e0-8589-d568475e34e6/iec-61850-7-6:2019)
- IEC TR 61850-7-500, Basic information and communication structure – Use of logical nodes for modelling application functions and related concepts and guidelines for substations, which illustrates and explains application functions for the substation/protection domain of Logical Nodes in modelling simple and complex functions, to improve common understanding in modelling and data exchange, and finally to lead to interoperable implementations. <https://standards.iteh.ai/catalog/standards/sist/bb06c3cc-630-45e0-8589-d568475e34e6/iec-61850-7-6:2019>
- IEC TR 61850-90-3, Using IEC 61850 for condition monitoring diagnosis and analysis, which gives use cases and data modelling for condition monitoring diagnosis and analysis functions for substation and power grid facilities.

This document does not describe the applications and respective implementation requirements; the focus is on their typical information exchange including data and communication services and engineering conventions.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1

Basic Application Profile

BAP

user/user group agreed-upon selection and interpretation of relevant parts of the applicable standards and specifications, intended to be used as building blocks for interoperable user/project specifications

Note 1 to entry: BAPs must not have options; all selected criteria are required to facilitate interoperability. For implementation in projects, BAPs might be extended or refined to meet the user specific requirements.

[SOURCE: CEN-CENELEC-ETSI SG-CG Report on Interoperability CEN_9762_CLC_9624 – Clause 12.1, Terms and definitions]

[IEC TR 61850-7-6:2019](https://standards.iteh.ai/catalog/standards/sist/bb06c3ec-a830-45ea-8589-da5f3475e34a/iec-tr-61850-7-6-2019)

3.2

Basic Application Interoperability Profile

BAIOP

interoperability test for BAPs defined by test sequences and test cases

[SOURCE: CEN-CENELEC-ETSI SG-CG Report on Interoperability CEN_9762_CLC_9624 – Clause 12.1, Terms and definitions]

3.3

compliance

accordance of the whole implementation with specified requirements or standards

Note 1 to entry: Some requirements in the specified standards may not be implemented.

[SOURCE: CEN-CENELEC-ETSI SG-CG Report on Interoperability CEN_9762_CLC_9624 – Clause 12.1, Terms and definitions]

3.4

conformance

accordance of the implementation of a product, process or service with all specified requirements or standards

Note 1 to entry: Additional features to those in the requirements / standards may be included.

Note 2 to entry: All features of the standard/specification are implemented and in accordance, but some additional features are not covered by the standard/specification.

[SOURCE: CEN-CENELEC-ETSI SG-CG Report on Interoperability CEN_9762_CLC_9624 – Clause 12.1, Terms and definitions]

3.5 conformance test

check of data flow on communication channels in accordance with the standard conditions concerning access organization, formats and bit sequences, time synchronization, timing, signal form & level and reaction to errors

Note 1 to entry: The conformance test can be carried out and certified to the standard or to specifically described parts of the standard. The conformance test should be carried out by an ISO 9001 certified organisation or system integrator.

Note 2 to entry: Beside the ISO 9001 certification also an accreditation by an appropriate entity is required for the testing organization or system integrator to perform a conformance test.

[SOURCE: IEC 61850-4:2011, 3.17, modified (addition of Note 2 to entry)]

3.6 interoperability

ability of two or more IEDs from the same vendor, or different vendors, to exchange and use information for correct execution of the specified functions

[SOURCE: IEC 61850-2:2003, 2.85]

3.7 interoperability testing

testing performed to verify that communicating entities within a system are interoperable, i.e. they are able to exchange information in a semantically and syntactic correct way

Note 1 to entry: During interoperability testing, entities are tested against peer entities known to be correct (profiles).

[SOURCE: CEN-CENELEC-ETSI SG-CG Report on Interoperability CEN_9762_CLC_9624 – Clause 12.1, Terms and definitions]

3.8 profile

agreed-upon subset of derived from a specification

Note 1 to entry: A common profile is required for achieving interoperability especially in those cases when a specification could have more than one interpretation and there are probably many optional features.

[SOURCE: IEC TR 62361-103:2018, 3.11]

3.9 SGAM

Smart Grid Architecture Model, the 3D-Model for Smart Grid mappings

High level conceptual model of the Smart Grid developed by the CENELEC M/490 Reference Architecture working group describing main actors of the Smart Grid and their main interactions.

[SOURCE: CEN-CENELEC-ETSI SG-CG Report on Interoperability CEN_9762_CLC_9624 – Clause 12.1, Terms and definitions]

4 Methodology for profiling

4.1 General

In general, profiling within a standard and between standards and specifications helps to both facilitate interoperability and meet expectations of different projects where these will be implemented.

Out of this broad basis of the definitions of the IEC 61850 standard series, specific subsets (selected by vendors) are implemented in products and systems.

IEC 61850 applications can also differ dependent on user type, region and philosophy. Stakeholders officially request guidelines and tools to facilitate interoperability in projects and therefore the challenge is to find a common concept/guideline to both facilitate interoperability and meet expectations of different projects.

Flexibility of standards which were created to meet the requirements of the industry of the global world, containing many options, contradicts with the goal of interoperability of functions. If a function can be implemented in more than one way in products, the risk that those products will be unable to perform the function in an interoperable way is high. To facilitate the goal of interoperability in addition to the mandatory elements the mandatory inclusion of selected optional elements offered by the standard may be defined. That limitation of options offered by a standard is done by defining commonly agreed subsets (profiles), which might be interpreted as disadvantageous inflexibility against specific user requirements.

To facilitate the goal of interoperability, a common understanding and interpretation of the related standard and the identical use of functional elements for required layers to fulfil application functions is necessary. This can be achieved by defining profiles. They could be best provided by User Groups in the domain of substation automation. A User Group consists of interested parties, e.g. utilities, vendors, certification bodies, test labs, system integrators and regulators, see Figure 1.

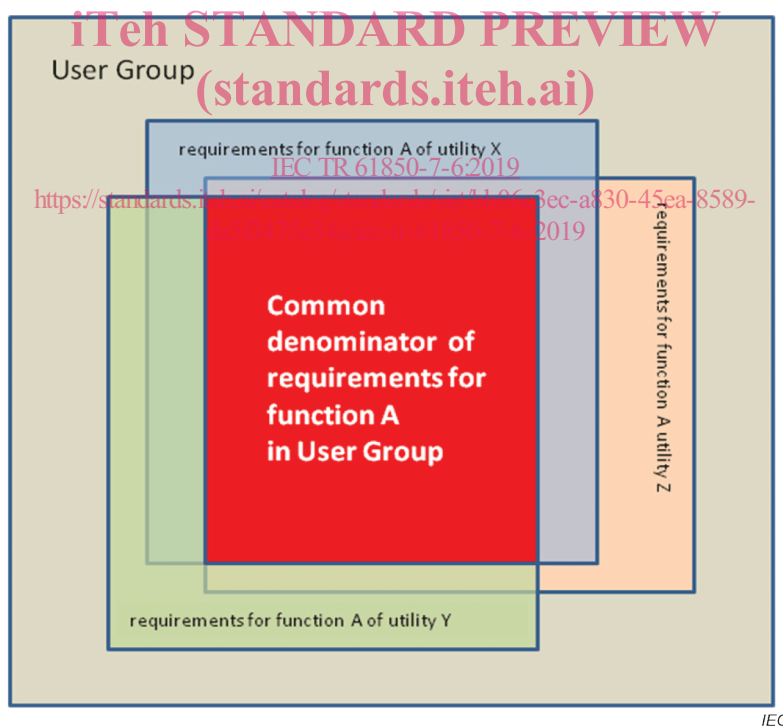

Figure 1 – Stakeholders collaborate in user groups to create a common IOP profile

IEC TR 62361-103:2018, 4.1, defines a common concept and framework for the process of profiling within the IEC.

4.2 IEC 61850 profiling concept

4.2.1 General

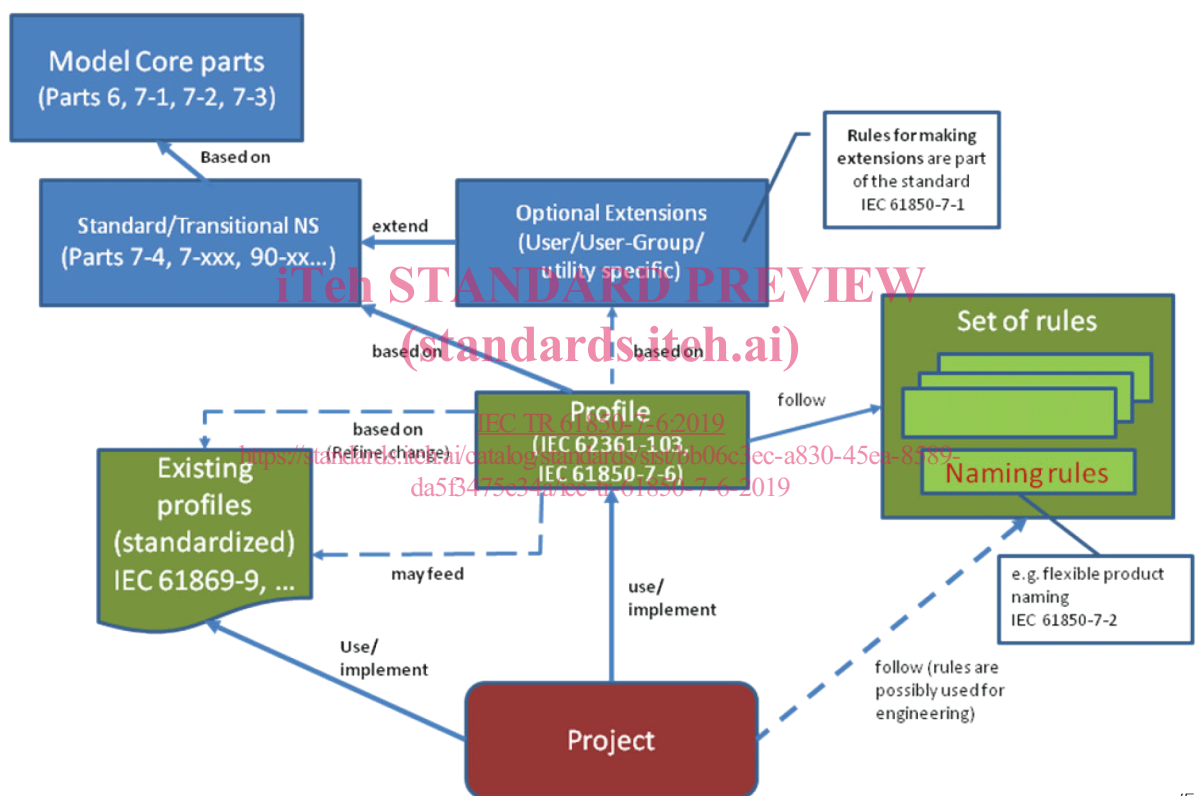

The primary goal of the IEC 61850 series is to facilitate interoperability in a modular way between subsystems and components in order to enable more or less complex system

functions. Therefore the IEC 61850 series covers specifications for functional and non-functional requirements, information and communication aspects for devices and systems as well as device and system engineering. With that the IEC 61850 series offers a broad basis for communication networks and systems in power utility automation.

Due to its broad coverage of power utility automation functions and applications, it is up to the user of the standard (utility, vendor, system integrator etc.) to pick and choose specific options offered by the standard in order to meet the requirements according to their intended project objectives. As a consequence, implementations of IEC 61850 represent specific subsets of the standard instead of covering it as a whole.

IEC 61850 profiles express (interoperability) requirements of actors' roles in a specific business context to be fulfilled by devices and systems.

4.2.2 IEC 61850 profile definition

IEC

Figure 2 – Framework for profiling IEC 61850

Figure 2 shows the main relationship between the different elements constituting the profiling activity of IEC 61850.

An IEC 61850 standard profile may contain a selection of data models (with mandatory and optional elements) and communication services applicable for a specific role within a detailed use case. The data models and communication services are all based on the same core parts as described in Figure 2.

It is acknowledged that a profile cannot be less demanding than the standard itself, i.e. a field or item said to be mandatory (or forbidden) by the standard shall remain mandatory (or forbidden) in a profile. The standard represents a sort of minimum base line.
