

Designation: E1358 – 97 (Reapproved 2019)

# Standard Test Method for Determination of Moisture Content of Particulate Wood Fuels Using a Microwave Oven<sup>1</sup>

This standard is issued under the fixed designation E1358; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

## 1. Scope

1.1 This test method provides an alternative method to Test Method E871, for the determination of the moisture of particulate wood fuels. Particulate wood fuels are defined in Terminology E1126.

1.2 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.4 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

## 3. Summary of Test Method

3.1 Moisture is determined by establishing the loss in mass of the sample when heated under rigidly controlled conditions of temperature, time, sample mass, and equipment specifications.<sup>4</sup>

## 4. Significance and Use

4.1 This test method provides a rapid determination for moisture in particulate wood fuels in several minutes. The standard method, Test Method E871, requires a minimum of 18 h. This method is applicable to situations such as the spot-check of the moisture delivered by truck where a quick indication of the moisture of wood delivered is desirable.

## 5. Apparatus

5.1 *Microwave Oven*—Any standard commercial microwave oven having a power output of at least 600 W can be used.

## 6. Procedure

6.1 Obtain a 50 g sample of the wood to be tested using techniques outlined in Test Method E871.

6.2 Determine the weight of 3 sheets of standard paper towels placed on top of each other. Record this mass as  $M_T$  (Mass of Towels).

6.3 Place the 50 g sample of the wood on top of the paper towels and determine the mass of the initial sample. Record the mass as  $M_{STI}$  (Mass of Sample and Towels Initial).

6.4 Place the sample in the microwave and heat on full power using the schedule shown in Table 1 for the type of wood fuel being tested. Remove sample and towels from oven after each heating interval, weigh, and stir. When the mass change between successive weighings is less than 0.5 g, record this mass as  $M_{STF}$  (Mass of Sample and Towels Final).
