**About the IEC**

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

**About IEC publications**

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

**IEC publications search - [webstore.iec.ch/advsearchform](http://webstore.iec.ch/advsearchform)**

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee, ...). It also gives information on projects, replaced and withdrawn publications.

**IEC online collection - [oc.iec.ch](http://oc.iec.ch)**

Discover our powerful search engine and read freely all the publications previews. With a subscription you will always have access to up to date content tailored to your needs.

**IEC Just Published - [webstore.iec.ch/justpublished](http://webstore.iec.ch/justpublished)**

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

**Electropedia - [www.electropedia.org](http://www.electropedia.org)**

The world's leading online dictionary on electrotechnology, containing more than 22 000 terminological entries in English and French, with equivalent terms in 18 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

**IEC Customer Service Centre - [webstore.iec.ch/csc](http://webstore.iec.ch/csc)**

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: [sales@iec.ch](mailto:sales@iec.ch).

## INTERNATIONAL ELECTROTECHNICAL COMMISSION

## SUPERCONDUCTIVITY –

**Part 17: Electronic characteristic measurements –  
Local critical current density and its distribution  
in large-area superconducting films**

## FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as “IEC Publication(s)”). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

**This redline version of the official IEC Standard allows the user to identify the changes made to the previous edition IEC 61788-17:2013. A vertical bar appears in the margin wherever a change has been made. Additions are in green text, deletions are in strikethrough red text.**

IEC 61788-17 has been prepared by IEC technical committee 90: Superconductivity. It is an International Standard.

This second edition cancels and replaces the first edition published in 2013. This edition constitutes a technical revision.

This edition includes the following a significant technical change with respect to the previous edition:

- a) A simple method to calculate theoretical coil coefficient  $k$  is described in 6.2.1.

The text of this International Standard is based on the following documents:

FDIS	Report on voting
90/462/FDIS	90/464/RVD

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

The language used for the development of this International Standard is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at [www.iec.ch/members\\_experts/refdocs](http://www.iec.ch/members_experts/refdocs). The main document types developed by IEC are described in greater detail at [www.iec.ch/standardsdev/publications](http://www.iec.ch/standardsdev/publications).

A list of all the parts of the IEC 61788 series, published under the general title *Superconductivity*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

**IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.**

## INTRODUCTION

Over thirty years after their discovery in 1986, high-temperature superconductors are now finding their way into products and technologies that will revolutionize information transmission, transportation, and energy. Among them, high-temperature superconducting (HTS) microwave filters, which exploit the extremely low surface resistance of superconductors, have already been commercialized. They have two major advantages over conventional non-superconducting filters, namely: low insertion loss (low noise characteristics) and high frequency selectivity (sharp cut) [1]<sup>1</sup>. These advantages enable a reduced number of base stations, improved speech quality, more efficient use of frequency bandwidths, and reduced unnecessary radio wave noise.

Large-area superconducting thin films have been developed for use in microwave devices [2]. They are also ~~used~~ considered for use in emerging superconducting power devices, such as resistive-type superconducting fault-current limiters (SFCLs) [3] [4] [5], superconducting fault detectors used for superconductor-triggered fault current limiters [6] [7] and persistent-current switches used for persistent-current HTS magnets [8] [9]. The critical current density  $J_c$  is one of the key parameters that describe the quality of large-area HTS films. Nondestructive, AC inductive methods are widely used to measure  $J_c$  and its distribution for large-area HTS films [10] [11] [12] [13], among which the method utilizing third-harmonic voltages  $U_3 \cos(3\omega t + \theta)$  is the most popular [10] [11], where  $\omega$ ,  $t$  and  $\theta$  denote the angular frequency, time, and initial phase, respectively. However, these conventional methods are not accurate because they have not considered the electric-field  $E$  criterion of the  $J_c$  measurement [14] [15] and sometimes use an inappropriate criterion to determine the threshold current  $I_{th}$  from which  $J_c$  is calculated [16]. A conventional method can obtain  $J_c$  values that differ from the accurate values by 10 % to 20 % [15]. It is thus ~~necessary~~ important to establish standard test methods to precisely measure the local critical current density and its distribution, to which all involved in the HTS filter industry can refer for quality control of the HTS films. Background knowledge on the inductive  $J_c$  measurements of HTS thin films is summarized in Annex A.

In these inductive methods, AC magnetic fields are generated with AC currents  $I_0 \cos \omega t$  in a small coil mounted just above the film, and  $J_c$  is calculated from the threshold coil current  $I_{th}$ , at which full penetration of the magnetic field to the film is achieved [17]. For the inductive method using third-harmonic voltages  $U_3$ ,  $U_3$  is measured as a function of  $I_0$ , and the  $I_{th}$  is determined as the coil current  $I_0$  at which  $U_3$  starts to emerge. The induced electric fields  $E$  in the superconducting film at  $I_0 = I_{th}$ , which are proportional to the frequency  $f$  of the AC current, can be estimated by a simple Bean model [14]. A standard method has been proposed to precisely measure  $J_c$  with an electric-field criterion by detecting  $U_3$  and obtaining the  $n$ -value (index of the power-law  $E$ - $J$  characteristics) by measuring  $I_{th}$  precisely at various frequencies [14] [15] [18] [19]. This method not only obtains precise  $J_c$  values, but also facilitates the detection of degraded parts in inhomogeneous specimens, because the decline of  $n$ -value is more ~~remarkable~~ noticeable than the decrease of  $J_c$  in such parts [15]. It is noted that this standard method is excellent for assessing homogeneity in large-area HTS films, although the relevant parameter for designing microwave devices is not  $J_c$ , but the surface resistance. For application of large-area superconducting thin films to SFCLs, knowledge on  $J_c$  distribution is vital, because  $J_c$  distribution significantly affects quench distribution in SFCLs during faults.

The International Electrotechnical Commission (IEC) draws attention to the fact that it is claimed that compliance with this document may involve the use of a patent ~~concerning the determination of the  $E$ - $J$  characteristics by inductive  $J_c$  measurements as a function of frequency, given in the Introduction, Clause 1, Clause 4 and 5.1~~. IEC takes no position concerning the evidence, validity, and scope of this patent right.

<sup>1</sup> Numbers in square brackets refer to the Bibliography.

The holder of this patent right has assured IEC that s/he is willing to negotiate licences ~~free of charge~~ under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statement of the holder of this patent right is registered with IEC. Information may be obtained from the patent database available at <http://patents.iec.ch>.

~~Name of holder of patent right:~~

~~National Institute of Advanced Industrial Science and Technology~~

~~Address:~~

~~Intellectual Property Planning Office, Intellectual Property Department-  
1-1-1, Umezono, Tsukuba, Ibaraki Prefecture, Japan~~

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights other than those ~~identified above~~ in the patent database. IEC shall not be held responsible for identifying any or all such patent rights.

~~ISO ([www.iso.org/patents](http://www.iso.org/patents)) and IEC (<http://patents.iec.ch>) maintain on-line data bases of patents relevant to their standards. Users are encouraged to consult the data bases for the most up-to-date information concerning patents.~~

## SUPERCONDUCTIVITY –

### Part 17: Electronic characteristic measurements – Local critical current density and its distribution in large-area superconducting films

#### 1 Scope

This part of IEC 61788 ~~describes~~ specifies the measurements of the local critical current density ( $J_c$ ) and its distribution in large-area high-temperature superconducting (HTS) films by an inductive method using third-harmonic voltages. The most important consideration for precise measurements is to determine  $J_c$  at liquid nitrogen temperatures by an electric-field criterion and obtain current-voltage characteristics from its frequency dependence. Although it is possible to measure  $J_c$  in applied DC magnetic fields [20] [21], the scope of this document is limited to the measurement without DC magnetic fields.

This technique intrinsically measures the critical sheet current that is the product of  $J_c$  and the film thickness  $d$ . The range and measurement resolution for  $J_c d$  of HTS films are as follows.

- $J_c d$ : from 200 A/m to 32 kA/m (based on results, not limitation).
- Measurement resolution: 100 A/m (based on results, not limitation).

#### 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

~~IEC 60050 (all parts), International Electrotechnical Vocabulary (available at <http://www.electropedia.org><<http://www.electropedia.org>>)~~

IEC 60050-815, *International Electrotechnical Vocabulary – Part 815: Superconductivity* (available at <<http://www.electropedia.org>>)

#### 3 Terms and definitions

For the purposes of this document, the terms and definitions given in IEC 60050-815:2000 apply, some of which are repeated here for convenience.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

##### 3.1 critical current

$I_c$

maximum direct current that can be regarded as flowing without resistance practically

Note 1 to entry:  $I_c$  is a function of magnetic field strength, temperature and strain.

[SOURCE: IEC 60050-815:20002015, 815-0312-01]

### 3.2 critical current criterion

#### $I_c$ criterion

criterion to determine the critical current,  $I_c$ , based on the electric field strength,  $E$ , or the resistivity,  $\rho$

Note 1 to entry:  $E = 10 \mu\text{V/m}$  or  $E = 100 \mu\text{V/m}$  is often used as electric field criterion, and  $\rho = 10^{-14} \Omega \cdot \text{m}$  or  $\rho = 10^{-13} \Omega \cdot \text{m}$  is often used as resistivity criterion. (“ $E = 10 \text{ V/m}$  or  $E = 100 \text{ V/m}$ ” in the current edition is mistaken and is scheduled to be corrected in the second edition).

[SOURCE: IEC 60050-815:20002015, 815-0312-02]

### 3.3 critical current density

#### $J_c$

electric current density at the critical current using either the cross-section of the whole conductor (overall) or of the non-stabilizer part of the conductor if there is a stabilizer

Note 1 to entry: The overall current density is called engineering current density (symbol:  $J_e$ ).

[SOURCE: IEC 60050-815:20002015, 815-0312-03]

### 3.4 transport critical current density

#### $J_{ct}$

critical current density obtained by a resistivity or a voltage measurement

[SOURCE: IEC 60050-815:20002015, 815-0312-04] [2021](https://standards.iteh.ai/catalog/standards/iec/eb1c76c0-cdb0-4fb0-8316-1e59e6145b05/iec-61788-17-2021)

### 3.5 $n$ -value

<superconductor> exponent obtained in a specific range of electric field strength or resistivity when the voltage/current  $U(I)$  curve is approximated by the equation  $U \propto I^n$

[SOURCE: IEC 60050-815:20002015, 815-0312-10]

## 4 Requirements

The critical current density  $J_c$  is one of the most fundamental parameters that describe the quality of large-area HTS films. In this document,  $J_c$  and its distribution are measured non-destructively via an inductive method by detecting third-harmonic voltages  $U_3 \cos(3\omega t + \theta)$ . A small coil, which is used both to generate AC magnetic fields and detect third-harmonic voltages, is mounted just above the HTS film and used to scan the measuring area. To measure  $J_c$  precisely with an electric-field criterion, the threshold coil currents  $I_{th}$ , at which  $U_3$  starts to emerge, are measured repeatedly at different frequencies and the  $E$ - $J$  characteristics are determined from their frequency dependencies.

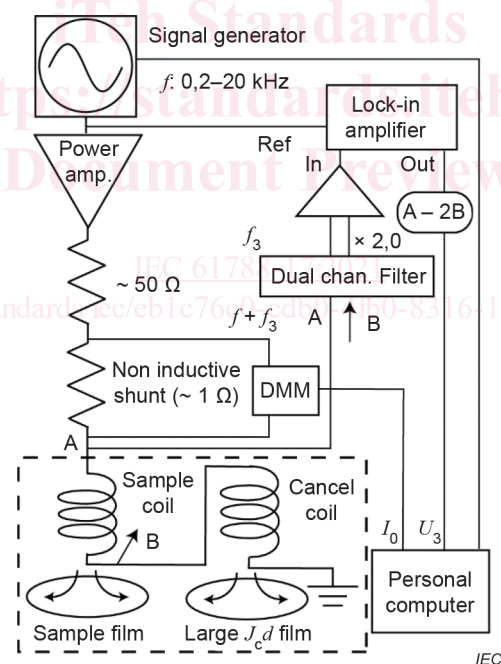

The target relative combined standard uncertainty in the method used to determine the absolute value of  $J_c$  is less than 10 %. However, the target uncertainty is less than 5 % for the purpose of evaluating the homogeneity of  $J_c$  distribution in large-area superconducting thin films.

## 5 Apparatus

### 5.1 Measurement equipment

Figure 1 shows a schematic diagram of a typical electric circuit used for the third-harmonic voltage measurements. This circuit is comprised of a signal generator, power amplifier, digital multimeter (DMM) to measure the coil current, band-ejection filter to reduce the fundamental wave signals and lock-in amplifier to measure the third-harmonic signals. It involves the single-coil approach in which the coil is used to generate an AC magnetic field and detect the inductive voltage. This method can also be applied to double-sided superconducting thin films **without hindrance with no obstacles**. In the methods proposed here, however, there is an additional system to reduce harmonic noise voltages generated from the signal generator and the power amplifier [14]. In an example of Figure 1, a cancel coil of specification being the same as the sample coil is used for cancelling. The sample coil is mounted just above the superconducting film, and a superconducting film with a  $J_c d$  sufficiently larger than that of the sample film is placed below the cancel coil to adjust its inductance to that of the sample coil. **Note that the inductance of the sample coil decreases by 20 % to 30 % due to the superconducting shielding current when it is mounted on a superconducting film.** Both coils and superconducting films are immersed in liquid nitrogen (a broken line in Figure 1). Other optional measurement systems are described in Annex B.

NOTE In this circuit, coil currents of about 0,1 A (RMS) and power source voltages of > 6 V (RMS) are needed to measure the superconducting film of  $J_c d \approx 10$  kA/m while using coil 1 or 2 of Table 2. A precision power amplifier, such as NF-HSA4011, with sufficiently high power is necessary used to supply such large currents and voltages.

NOTE The broken line surrounds elements immersed in liquid nitrogen.

**Figure 1 – Diagram for an electric circuit used for inductive  $J_c$  measurement of HTS films**

## 5.2 Components for inductive measurements

### 5.2.1 Coils

Currently available large-area HTS films are deposited on areas as large as about 25 cm in diameter, while films about 5 cm in diameter are commercially used to prepare microwave filters [22]. Larger  $\text{YBa}_2\text{Cu}_3\text{O}_7$  (YBCO) films, about 10 cm in diameter and 2,7 cm x 20 cm, were used to fabricate fault current limiter modules [3] [4] [5]. For the  $J_c$  measurements of such films, the appropriate outer diameter of the sample coils ranges from 2 mm to 5 mm. The requirement for the sample coil is to generate as high a magnetic field as possible at the upper surface of the superconducting film, for which flat coil geometry is suitable. Typical specifications are as follows.

- a) Inner winding diameter  $D_1$ : 0,9 mm, outer diameter  $D_2$ : 4,2 mm, height  $h$ : 1,0 mm, 400 turns of a 50  $\mu\text{m}$  diameter copper wire.
- b)  $D_1$ : 0,8 mm,  $D_2$ : 2,2 mm,  $h$ : 1,0 mm, 200 turns of a 50  $\mu\text{m}$  diameter copper wire.

### 5.2.2 Spacer film

Typically, a polyimide film with a thickness of 50  $\mu\text{m}$  to 125  $\mu\text{m}$  is used to protect the HTS films. The coil has generally some protection layer below the coil winding, which also insulates the thin film from Joule heat in the coil. The typical thickness is 100  $\mu\text{m}$  to 150  $\mu\text{m}$ , and the coil-to-film distance  $Z_1$  is kept to be 200  $\mu\text{m}$ .

### 5.2.3 Mechanism for the set-up of the coil

To maintain a prescribed value for the spacing  $Z_1$  between the bottom of the coil winding and the film surface, the sample coil should be pressed to the film with sufficient pressure, typically exceeding about 0,2 MPa [18]. Techniques to achieve this are to use a weight or spring, as shown in Figure 2. The system schematically shown in the figure left is used to scan a wide area of the film. Before the  $U_3$  measurement the coil is initially ~~moved~~ raised up to some distance, moved laterally to the target position, and then ~~moved~~ lowered down and pressed to the film. An appropriate pressure should be determined so that too high pressure does not damage the bobbin, coil, HTS thin film or the substrate. It is reported that the YBCO deposited on biaxially-textured pure Ni substrate was degraded by transverse compressive stress of about 20 MPa [23].
