About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22,000 terminological entries in English and French, with equivalent terms in 16 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

67,000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

A propos de l'IEC

La Commission Electrotechnique Internationale (IEC) est la première organisation mondiale qui élabore et publie des Normes internationales pour tout ce qui a trait à l'électricité, à l'électronique et aux technologies apparentées.

A propos des publications IEC

Le contenu technique des publications IEC est constamment revu. Veuillez vous assurer que vous possédez l'édition la plus récente, un corrigendum ou amendement peut avoir été publié.

Recherche de publications IEC -

webstore.iec.ch/advsearchform

La recherche avancée permet de trouver des publications IEC en utilisant différents critères (numéro de référence, texte, comité d'études,...). Elle donne aussi des informations sur les projets et les publications remplacées ou retirées.

IEC Just Published - webstore.iec.ch/justpublished

Restez informé sur les nouvelles publications IEC. Just Published détaille les nouvelles publications parues. Disponible en ligne et une fois par mois par email.

Service Clients - webstore.iec.ch/csc

Si vous désirez nous donner des commentaires sur cette publication ou si vous avez des questions contactez-nous: sales@iec.ch.

Electropedia - www.electropedia.org

Le premier dictionnaire d'électrotechnologie en ligne au monde, avec plus de 22 000 articles terminologiques en anglais et en français, ainsi que les termes équivalents dans 16 langues additionnelles. Egalement appelé Vocabulaire Electrotechnique International (IEV) en ligne.

Glossaire IEC - std.iec.ch/glossary

67 000 entrées terminologiques électrotechniques, en anglais et en français, extraites des articles Termes et Définitions des publications IEC parues depuis 2002. Plus certaines entrées antérieures extraites des publications des CE 37, 77, 86 et CISPR de l'IEC.

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 60749-20 has been prepared by IEC technical committee 47: Semiconductor devices.

This third edition cancels and replaces the second edition published in 2008. This edition constitutes a technical revision.

This edition includes the following significant technical changes with respect to the previous edition:

- a) incorporation of a technical corrigendum to IEC 60749-20:2008 (second edition);
- b) inclusion of new Clause 3;
- c) inclusion of explanatory notes.

The text of this International Standard is based on the following documents:

FDIS	Report on voting
47/2634/FDIS	47/2646/RVD

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 60749 series, published under the general title *Semiconductor devices – Mechanical and climatic test methods*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

SEMICONDUCTOR DEVICES – MECHANICAL AND CLIMATIC TEST METHODS –

Part 20: Resistance of plastic encapsulated SMDs to the combined effect of moisture and soldering heat

1 Scope

This part of IEC 60749 provides a means of assessing the resistance to soldering heat of semiconductors packaged as plastic encapsulated surface mount devices (SMDs). This test is destructive.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1

acoustic tomography

determination of the physical qualities of a known substance by measuring how long it takes sound to travel through it

3.2

classification reflow temperature

T_c

maximum body temperature for which the component moisture sensitivity level (MSL) is verified by the component manufacturer and as noted on the caution and/or bar code label

3.3**crack**

separation within a bulk material

Note 1 to entry: See also delamination (3.5).

3.4**dead-bug orientation**

orientation of a package with the terminals facing upwards

3.5**delamination**

interfacial separation between two materials intended to be bonded

Note 1 to entry: See also crack (3.3).

3.6**floor life**

allowable time period after removal from a moisture barrier bag, dry storage, or dry bake and before the solder reflow process

Note 1 to entry: For the purposes of this document "unlimited" floor life only refers to moisture/reflow related failures and does not take into consideration other failure mechanisms or shelf life issues due to long term storage.

3.7**live-bug orientation**

orientation of a package when resting on its terminals

3.8**moisture sensitivity level****MSL**

rating indicating a component's susceptibility to damage due to absorbed moisture when subjected to reflow soldering

3.9**soak**

exposure of a component for a specified time at a specified temperature and humidity

4 General description

Package cracking and electrical failure in plastic encapsulated SMDs can result when soldering heat raises the vapour pressure of moisture which has been absorbed into SMDs during storage. These problems are assessed. In this test method, SMDs are evaluated for heat resistance after being soaked in an environment which simulates moisture being absorbed while under storage in a warehouse or dry pack. Moisture sensitivity level (MSL) ratings generated by this document are utilized to determine the soak conditions for preconditioning in accordance with IEC 60749-30.

5 Test apparatus and materials**5.1 Humidity chamber**

The humidity chamber shall provide an environment complying with the temperature and relative humidity defined in 6.3.

5.2 Reflow soldering apparatus

The infrared convection, the convection and the vapour-phase reflow soldering apparatus shall provide temperature profiles complying with the conditions of soldering heat defined in 6.4.2 and 6.4.3. The settings of the reflow soldering apparatus shall be adjusted by temperature profiling of the top surface of the specimen while it is undergoing the soldering heat process, measured as shown in Figure 1.

The adhesive agent or thin tape should have good thermal conductivity.

Figure 1 – Method of measuring the temperature profile of a specimen

5.3 Holder

Unless otherwise detailed in the relevant specification any board material, such as epoxy fibreglass or polyimide, may be used for the holder. The specimen shall be placed on the holder by the usual means and in a position as shown in Figure 1. If the position of the specimen, as shown in Figure 1, necessitates changing the shape of terminations and results in subsequent electrical measurement anomalies, a position that avoids changing the shape of terminations may be chosen, and this shall be specified in the relevant specification.

5.4 Wave-soldering apparatus

The wave-soldering apparatus shall comply with conditions given in 6.4.4. Molten solder shall usually be flowed.

5.5 Solvent for vapour-phase reflow soldering

Perfluorocarbon (perfluoroisobutylene) shall be used.

5.6 Flux

Unless otherwise detailed in the relevant specification, the flux shall consist of 25 % by weight of colophony in 75 % by weight of isopropyl alcohol, both as specified in Annex B of IEC 60068-2-20:2008.

5.7 Solder

A solder of the composition as specified in Table 1 of IEC 60068-2-20:2008 shall be used.

6 Procedure

6.1 Initial measurements

6.1.1 Visual inspection

Visual inspection, as specified in IEC 60749-3, shall be performed before the test. Special attention shall be paid to external cracks and swelling, which will be looked for under a magnification of 40X.

6.1.2 Electrical measurement

Electrical testing shall be performed as required by the relevant specification.

6.1.3 Internal inspection by acoustic tomography

Unless otherwise detailed in the relevant specification, internal cracks and delamination in the specimen shall be inspected by acoustic tomography in accordance with IEC 60749-35.

6.2 Drying

Unless otherwise detailed in the relevant specification, the specimen shall be baked at $125\text{ °C} \pm 5\text{ °C}$ for at least 24 h.

NOTE 1 This time/temperature is modified if desorption data on the particular device under test shows that a different condition is required to obtain a "dry" package when starting in the wet condition for 85 °C/85 % RH.

NOTE 2 If a bake test is interrupted for more than 15 min, then the total time of the interruption is excluded from the bake time. The interruption time is taken into account (if no greater than 1 h) then re-incorporated to ensure a minimum of 24 h. For instance, if the interruption was 45 min, then the total bake test time would be 24 h and 45 min. If greater than 1 h the bake is restarted for a full 24 h.

6.3 Moisture soak

6.3.1 General

Unless otherwise detailed in the relevant specification, moisture soak conditions shall be selected on the basis of the packing method of the specimen (see A.1.1, Annex A). If baking the specimen before soldering is detailed in the relevant specification, the specimen shall be baked instead of being subjected to moisture soak.

6.3.2 Conditions for non-dry-packed SMDs

The moisture soak condition shall be selected from Table 1, in accordance with the permissible limit of actual storage (see A.1.2.1).

Table 1 – Moisture soak conditions for non-dry-packed SMDs

Condition	Temperature °C	Relative humidity %	Duration time h	Permissible limit on actual storage
A1 or B1	85 ± 2	85 ± 5	168 ± 24	< 30 °C, 85 % RH
RH: relative humidity				
NOTE Conditions A1 and B1 indicate moisture soak for non-dry-packed SMDs under either method A or B.				

6.3.3 Moisture soak for dry-packed SMDs

6.3.3.1 General

Moisture soak conditions for dry-packed SMDs may be used as specified in method A, Table 2, or method B, Table 3. Moisture soak conditioning for dry-packed SMDs consists of two stages. The first stage of conditioning is intended to simulate moisturizing SMDs before opening the dry pack/dry cabinet. The second stage of conditioning is to simulate moisturizing SMDs during storage after opening the dry pack for soldering (floor life). Moisture soak conditioning for dry-packed SMDs shall be selected from method A or B. Method A shall be used when the relative humidity in the dry pack or dry cabinet is specified by the manufacturer as being between 10 % and 30 %. Method B shall be used when the relative humidity in the dry pack or dry cabinet is specified by the manufacturer as being below 10 %.

6.3.3.2 Method A

Unless otherwise detailed in the relevant specification, the first stage conditioning of A2, as shown in Table 2, shall be performed. Subsequently, the second stage conditioning of A2, as shown in Table 2, shall be performed within 4 h of finishing the first stage of conditioning (see A.1.2.2).

The relative humidity of the first stage conditioning shall be the same as the upper limit of the relative humidity inside the moisture barrier bag. The relative humidity of the second stage conditioning shall be the same as the conditions of floor life.

Where required in the relevant specification, test conditions other than those of the moisture barrier bag and floor life conditions may be specified in the moisture soak conditions of Table 2.

Table 2 – Moisture soak conditions for dry-packed SMDs (method A)

Condition	Moisture soak conditions	Permissible storage conditions in the dry pack and the dry cabinet	Condition of floor life
A2 first-stage conditioning	$(85 \pm 2) ^\circ\text{C}$, $(30 \pm 5) \% \text{ RH}$, 168 $^{24}_{-0}$ h	$< 30 ^\circ\text{C}$, 30 % RH, 1 year	–
A2 second-stage conditioning	$(30 \pm 2) ^\circ\text{C}$, $(70 \pm 5) \% \text{ RH}$, 168 $^{24}_{-0}$ h	–	$< 30 ^\circ\text{C}$, 70 % RH, 168 h
RH: Relative humidity			

NOTE 1 The first stage of conditioning represents storage conditions in the dry pack and the dry cabinet, as well as increasing relative humidity in the dry pack, by repacking the SMDs at the distributor's facility and the user's inspection facility. When condition A2 is applied, the SMDs are packed into a moisture-proof bag with IC trays and desiccants within a few weeks of drying. They can then be subjected to multiple temporary openings of the moisture-proof bag (for several hours at a time). Repack and inspection of SMDs are possible while the humidity indicator in the dry pack indicates less than 30 % RH since SMDs will recover the initial condition of absorbed moisture within a few days of repacking. In this case, the moisture content measurement of SMDs (see Clause A.2) is not needed as a moisture control of the dry pack. A check of the moisture indicator is sufficient for moisture control.

NOTE 2 When moisture soak of the first-stage conditioning does not result in saturation, the soak time is extended to 336 h, because SMDs in a dry pack or dry cabinet will become saturated with moisture during long-term storage. When moisture soak of the first stage of conditioning reaches saturation, the soak time is shortened.

6.3.3.3 Method B

The condition of moisture soak conditioning shall be selected from Table 3 in accordance with the condition of the floor life detailed in the relevant specification (see A.1.2.3).

Table 3 – Moisture soak conditions for dry-packed SMDs (method B)

Condition	Moisture soak conditions	Total conditions from baking to dry packing and temporary opening of the dry pack	Condition of floor life
B2	(85 ± 2) °C, (60 ± 5) % RH, 168 ⁺²⁴ ₋₂₄ h	< 30 °C, 60 % RH, 24 h	< 30 °C, 60 % RH, 1 year
B2a	(30 ± 2) °C, (60 ± 5) % RH, 696 ⁺²⁴ ₋₂₄ h	< 30 °C, 60 % RH, 24 h	< 30 °C, 60 % RH, 4 weeks
B3	(30 ± 2) °C, (60 ± 5) % RH, 192 ⁺²⁴ ₋₀ h	< 30 °C, 60 % RH, 24 h	< 30 °C, 60 % RH, 168 h
B4	(30 ± 2) °C, (60 ± 5) % RH, 96 ⁺²⁴ ₋₀ h	< 30 °C, 60 % RH, 24 h	< 30 °C, 60 % RH, 72 h
B5	(30 ± 2) °C, (60 ± 5) % RH, 72 ⁺²⁴ ₋₀ h	< 30 °C, 60 % RH, 24 h	< 30 °C, 60 % RH, 48 h
B5a	(30 ± 2) °C, (60 ± 5) % RH, 48 ⁺²⁴ ₋₀ h	< 30 °C, 60 % RH, 24 h	< 30 °C, 60 % RH, 24 h
B6	(30 ± 2) °C, (60 ± 5) % RH, 6 ⁺²⁴ ₋₀ h		< 30 °C, 60 % RH, 6 h
RH: relative humidity			

NOTE Moisture soak conditions from B2 to B6 consist of the first-stage conditioning (30 °C, 60 % RH, 24 h) and the second-stage conditioning (floor life).

Contents in the dry pack of SMDs, IC trays and other materials, should be fully dried just before packing into the moisture-proof bag and the desiccant should be completely dry. This is because moist materials and degraded desiccants give off water vapour, causing the relative humidity in the dry pack to exceed 10 %. The relative humidity in the dry pack should be verified by the humidity indicator and the moisture content measurement of the SMDs, as shown in Clause A.2.

Storage of SMDs in a dry cabinet instead of a dry pack is not recommended because very low relative humidity cannot be obtained in a dry cabinet.

The individual conditions of method B should cover total storage condition from baking the SMDs to soldering them, and this should include the duration time of room storage from baking the SMDs to packing them into the dry pack, temporary opening of the dry pack and the floor life.

6.4 Soldering heat

6.4.1 General

Unless otherwise detailed in the relevant specification, the specimen shall be subjected to soldering heat within 4 h of finishing the moisture soak or baking. The method and condition of soldering heat shall be selected from 6.4.2 to 6.4.4 according to the relevant specification. Whichever method is chosen, the soldering heat cycles shall be a minimum of one and a maximum of three. Unless otherwise detailed in the relevant specification, one cycle of soldering heat shall be used. If more than one cycle is selected, the specimen shall be cooled down to below 50 °C before the second, and subsequent, soldering heat.

NOTE If the specimen is not affected by moisture soak and drying, which takes place during room storage of over 4 h, a storage time exceeding 4 h following the completion of moisture soak or the baking can be detailed in the relevant specification.

6.4.2 Method of heating by infrared convection or convection reflow soldering

6.4.2.1 Preparation

The specimen shall be put on the holder.

6.4.2.2 Preheating

Unless otherwise specified in the relevant specification, the specimen shall be preheated at a temperature conditions range shown in A.3.1 for 60 s to 120 s in the reflow soldering apparatus.

6.4.2.3 Solder heating

Following preheating, the temperature of the specimen shall be raised to peak temperature and then lowered to room temperature. The heating condition shall be selected from Table 4 or Table 5 in accordance with the relevant specification depending on the actual soldering conditions. Tolerances of temperature and time are shown in A.3.1.

NOTE 1 In Table 4 and Table 5, the conditions of method A are applied for actual soldering on condition of short temperature profile, and the conditions of method B are applied for actual soldering on condition of long temperature profile.

NOTE 2 Following preheating, the temperature of the specimen will follow the values as indicated in the profile given in Figure A.9, Figure A.10 or Table A.2.

NOTE 3 Package “volume” excludes external terminals (e.g., balls, bumps, lands, leads) and/or non-integral heat sinks. Package volume includes the external dimensions of the package body, regardless of whether it has a cavity or is a passive package style.

NOTE 4 At the discretion of the device manufacturer, but not the board assembler/user, the maximum peak package body temperature (T_p) can exceed the values specified in Table 4 or Table 5. The use of a higher T_p does not change the classification temperature (T_c).

NOTE 5 The maximum component temperature reached during reflow depends on package thickness and volume. The use of convection reflow processes reduces the thermal gradients between packages. However, thermal gradients due to differences in thermal mass of SMD packages can still exist.

NOTE 6 Moisture sensitivity levels of components intended for use in a Pb-free assembly process are evaluated using the Pb-free classification temperatures and profiles defined in Table 4 and Table 5, whether or not the process is Pb-free.

Table 4 – SnPb eutectic process – Classification reflow temperatures (T_c)

Package thickness mm	Method	Time within 5 °C of specified classification temperature s	Temperature for volume mm ³		
			< 350 °C	350 to 2 000 °C	< 2 000 °C
< 2,5	Method A	10	240	240	225
	Method B	20	240	225	225
≥ 2,5	Method A	10	240	240	225
	Method B	20	225	225	225

Table 5 – Pb-free process – Classification reflow temperatures (T_c)

Package thickness mm	Method	Time within 5 °C of specified classification temperature s	Temperature for volume mm ³		
			<350 °C	350 to 2 000 °C	> 2 000 °C
< 1,6	Method A	10	260	260	260
		20			
	Method B	30			
1,6 to 2,5	Method A	10	260	250	245
		20			
	Method B	30			
> 2,5	Method A	10	250	245	245
		20			
	Method B	30			

6.4.3 Method of heating by vapour-phase reflow soldering

6.4.3.1 Preparation

The specimen shall be put on the holder.

6.4.3.2 Preheating

Unless otherwise specified in the relevant specification, the specimen shall be preheated at a temperature from 100 °C to 160 °C for 1 min to 2 min in the vapour-phase soldering apparatus.

6.4.3.3 Solder heating

The temperature of the specimen shall be raised after preheating. When the temperature of the specimen has reached 215 °C ± 5 °C, it shall be maintained for 40 s ± 4 s as shown in Table 6 (refer to A.3.2).

Table 6 – Heating condition for vapour-phase soldering

Condition	Temperature °C	Time s
II-A	215 ± 5	40 ± 4

6.4.4 Method of heating by wave-soldering

6.4.4.1 Preparation

The bottom surface of the specimen shall be fixed to the holder by an adhesive agent specified in the relevant specification. Unless otherwise detailed in the relevant specification, flux shall not be applied to the specimen and holder.

If flux is applied, vaporization of solvent in the flux could affect the temperature rise of the specimen. Flux should not, therefore, be applied to the body of the specimen and should only be applied to lead pins as sparingly as possible.
