

Standard Specification for Insulation Resistance Monitor for Shipboard Electrical Motors and Generators¹

This standard is issued under the fixed designation F1134; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers monitoring devices (monitors) for the automatic detection and signaling of low insulation resistance values in idle electrical motors or generators, or both.

1.2 Monitors are intended for permanent installation in both existing or new panels and controller enclosures designed for marine application.

1.3 The values stated in SI units are to be regarded as standard. The values given in parentheses are mathematical conversions to inch-pound units that are provided for information only and are not considered standard.

1.4 The following safety hazards caveat pertains only to the test method described in this specification: *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.5 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

3. Terminology

3.1 *Definitions*—In general, definitions shall be in accordance with IEEE 100 (see Section 2).

3.2 *Definitions of Terms Specific to This Standard*:

3.2.1 *idle machine, n*—rotary machine, when not rotating, owing to the absence of energy.

3.2.2 *monitor, n*—device, generally located in a motor starter, control panel, or main switchboard, that senses the leakage resistance of electrical machine windings to ground, while the monitored machine stands idle.

4. Monitor Classification

4.1 *Type*—The insulation resistance monitors covered by this specification shall be of the following types:

4.1.1 *Type I*—Alternating current motor monitors.

4.1.2 *Type II*—Alternating current generator monitors.

4.1.3 *Type III*—Direct current motor monitors.

4.1.4 *Type IV*—Direct current generator monitors.

4.2 *Duty Rating*—All monitors shall be capable of continuous duty operations as defined in accordance with IEEE 100.

5. Ordering Information

5.1 Monitoring devices shall be ordered by including the following information:

5.1.1 *Purpose or Use of Monitor(s)*—Application as motor or generator monitor.

5.1.2 Line voltage and frequency.

5.1.3 Control voltage and frequency.

5.1.4 Type of starter (if motor monitor).

5.1.5 Winding configuration (if motor monitor).

5.1.6 Location of monitor.

5.1.7 *Sensitivity*—Set for 1 megohm (optional setting, if requested, from 0.1 to 5 M Ω).
