

Designation: D6594 – 19

Standard Test Method for Evaluation of Corrosiveness of Diesel Engine Oil at 135 °C¹

This standard is issued under the fixed designation D6594; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

INTRODUCTION

Any properly equipped laboratory, without outside assistance, can use the procedure described in this test method. However, the ASTM Test Monitoring Center (TMC)² provides reference oils and an assessment of the test results obtained on those oils by the laboratory (see Annex A1). By these means, the laboratory will know whether their use of the test method gives results statistically similar to those obtained by other laboratories. Furthermore, various agencies require that a laboratory utilize the TMC services in seeking qualification of oils against specifications. For example, the U.S. Army imposes such a requirement in connection with several Army engine lubricating oil specifications.

Accordingly, this test method is written for use by laboratories that utilize the TMC services. Laboratories that choose not to use those services may simply ignore those portions of the test method that refer to the TMC.

This test method may be modified by means of information letters issued by the TMC. In addition, the TMC may issue supplementary memoranda related to the method (see Annex A1). For other information, refer to the research report of this test method.³

1. Scope*

1.1 This test method covers testing diesel engine lubricants to determine their tendency to corrode various metals, specifically alloys of lead and copper commonly used in cam followers and bearings.

1.2 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.3 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.

1.4 This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.

3. Terminology

¹This test method is under the jurisdiction of ASTM Committee D02 on Petroleum Products, Liquid Fuels, and Lubricants and is the direct responsibility of Subcommittee D02.B0.02 on Heavy Duty Engine Oils.

Current edition approved July 1, 2019. Published July 2019. Originally approved in 2000. Last previous edition approved in 2014 as D6594 – 14. DOI: 10.1520/D6594-19.

² The ASTM Test Monitoring Center will update changes in this test method by means of Information Letters. This edition incorporates revisions contained in all Information Letters through 18-1. Information Letters may be obtained from the ASTM Test Monitoring Center, 6555 Penn Ave., Pittsburgh, PA 15206-4489, Attention: Administrator.

^{3.1} *Definitions:*

⁴ For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For *Annual Book of ASTM Standards* volume information, refer to the standard's Document Summary page on the ASTM website.

 $^{^{\}rm 5}\,{\rm The}$ last approved version of this historical standard is referenced on www.astm.org.

3.1.1 *corrosion*, n—the chemical or electrochemical reaction between a material, usually a metal surface, and its environment that can produce a deterioration of the material and its properties. D5844

3.1.2 *developer, n—of an ASTM test method*, the assigned ASTM group, working under the supervision of its governing subcommittee and main committee, that formats the test method in accordance with the Form and Style for ASTM Standards, and continually refines the test method.

3.1.3 developer, n—of a test procedure, an individual or organization that selects the test apparatus and operating conditions.

3.1.4 *non-reference oil, n*—any oil other than a reference oil; such as a research formulation, commercial oil, or candidate oil. **D5844**

3.1.5 *reference oil, n*—an oil of known performance characteristics, used as a basis for comparison. **D5844**

3.1.5.1 *Discussion*—Reference oils are used to calibrate testing facilities, to compare the performance of other oils, or to evaluate other materials (such as seals) that interact with oils.

3.1.6 *specimen*, *n*—a piece or portion of a sample used to make a test.

3.1.7 sponsor, n—of an ASTM test method, an organization that is responsible for ensuring supply of the apparatus used in the test procedure portion of the test method.

3.1.7.1 *Discussion*—In some instances, such as a test method for chemical analysis, an ASTM working group can be the sponsor of a test method. In other instances, a company with a self-interest may or may not be the developer of the test procedure used within the test method, but is the sponsor of the test method.

3.1.8 *test oil, n*—any oil subjected to evaluation in an established procedure. D6557

4. Summary of Test Method

4.1 Four metal specimens of copper, lead, tin, and phosphor bronze are immersed in a measured amount of engine oil. The oil, at an elevated temperature, is blown with air for a period of time. When the test is completed, the copper specimen and the stressed oil are examined to detect corrosion and corrosion products, respectively.

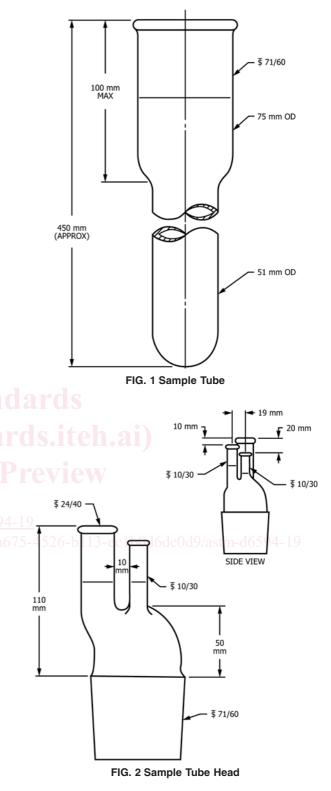

4.2 A reference oil is tested with each group of tests to verify test acceptability.

5. Significance and Use

5.1 This test method is intended to simulate the corrosion process of non-ferrous metals in diesel lubricants. The corrosion process under investigation is that believed to be induced primarily by inappropriate lubricant chemistry rather than lubricant degradation or contamination. This test method has been found to correlate with an extensive fleet database containing corrosion-induced cam and bearing failures.³

6. Apparatus

6.1 The main apparatus consists of the following items of standard wall borosilicate glassware as shown in Figs. 1-6.

- 6.1.1 Main Sample Tube, Fig. 1.
- 6.1.2 Sample Tube Head, Fig. 2.
- 6.1.3 Air Tube, Fig. 3.
- 6.1.4 Thermocouple Tube, Fig. 4.
- 6.1.5 Condenser, Allihn Type, Fig. 5.
- 6.1.6 Assembled Apparatus, Fig. 6.

D6594 – 19

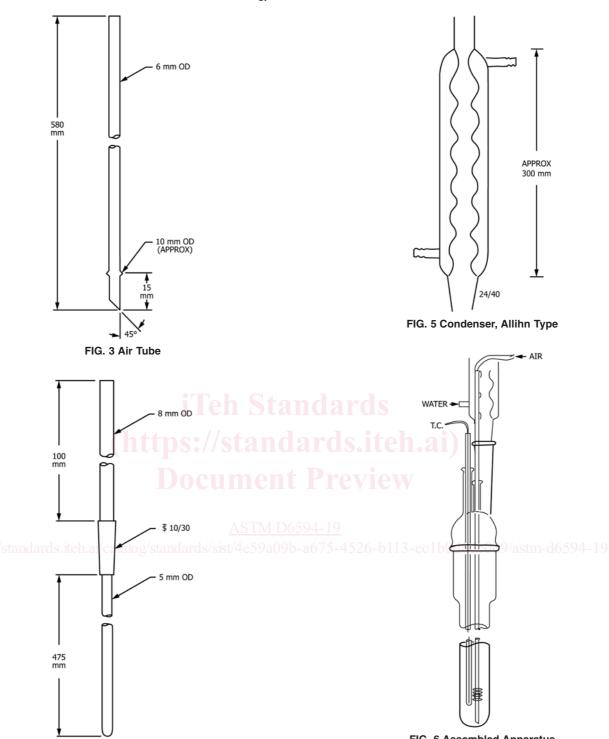

FIG. 4 Thermocouple Tube

FIG. 6 Assembled Apparatus

6.2 Additional glassware items and assembly accessories needed are:

6.2.1 *Hanger* (for metal specimens), of stainless steel, having the dimensions listed in Fig. 7.

6.2.2 *Adapter*, polytetrafluoroethylene for 10/18 joint for sealing of the air tube to the sample tube head.

6.3 Other items and equipment are:

6.3.1 Heating bath, with constant temperature control within ± 0.5 °C of test temperature with an immersion depth of 23 cm to 35 cm. Oil baths are recommended. (**Warning**—There are exposed hot surfaces on apparatus. Avoid skin contact by use of protective equipment.)

6.3.2 *Ventilation*, to adequately remove fumes during heating.

6.3.3 Air Supply, use air from a clean, dry source.

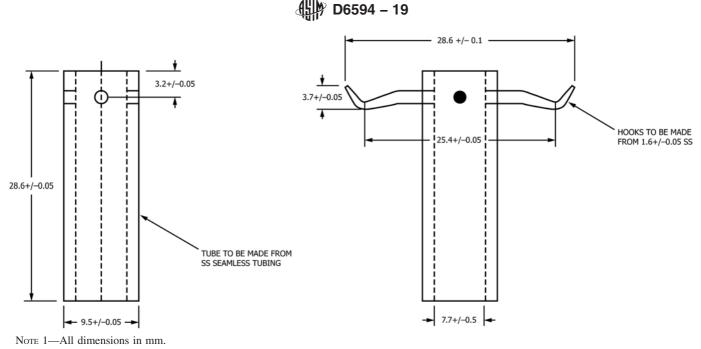

FIG. 7 Specimen Hanger

6.3.3.1 An air drier is required when air needs to be conditioned. The method used is optional provided the air characteristics of 6.3.3 are attained. For drying, a satisfactory method is the use of a glass column containing 8-mesh anhydrous calcium sulfate with a column diameter such that velocity of air does not exceed 1.2 m/min.

6.3.4 *Flowmeter*, capable of measuring $10 \text{ L/h} \pm 1 \text{ L/h}$. 6.3.5 *Syringe*, capable of accurately measuring out 100 mL of liquid.

6.3.6 *Oven*, optional, to dry glassware at elevated temperature. standards iteh alcatalog/standards/sist/4e59a09

6.3.7 Forceps, stainless steel; or gloves (powder free).

6.3.8 *Thermocouple*, or equivalent. Use sheathed thermocouple when the thermocouple is in direct contact with oil. When a thermocouple well is used, use a sheathed or unsheathed thermocouple in the well to control sample temperature; fill thermocouple well with a heat transfer medium.

6.3.9 Sanding Block and Holder, for specimen preparation.

7. Reagents and Materials

7.1 *Purity of Reagents*—Use reagent grade chemicals in all tests. Unless otherwise indicated, it is intended that all reagents conform to the specifications maintained by the Committee on Analytical Reagents of the American Chemical Society.⁶

7.2 Metal Specimens^{7,8}

7.2.1 Specimens are 0.081 cm thick by 2.5 cm square, except the lead specimen, which is 0.157 cm thick. One specimen from each of the following metal types, each with two drilled holes (as shown in Fig. 7), is required:

7.2.1.1 Copper (R401-A),

7.2.1.2 Lead (R401-lead),

7.2.1.3 *Tin* (R401-tin), and

7.2.1.4 Phosphor Bronze (R401-PBz).

7.3 *Abrasive Paper*,⁹ 240-grit aluminum oxide and 400-grit silicon carbide. Do not use iron-containing abrasives such as natural emery.

7.4 Cotton, 100 %.

7.5 *Acetone* (ACS), sulfur free. (**Warning**—Flammable. Health hazard.)

7.6 *Glassware Cleaning Solution*, Contrad (trademark) 70.^{10,8} (**Warning**—Health hazard.)

7.7 Heptane. (Warning—Flammable. Health hazard.)

7.8 *Cleaning Solvent*—Cyclohexane or heptane, industrial grade. (**Warning**—Both are flammable and health hazards.)

7.9 Reference Oil.²

8. Preparation of Apparatus

8.1 Cleaning:

⁶ Reagent Chemicals, American Chemical Society Specifications, American Chemical Society, Washington, DC. For Suggestions on the testing of reagents not listed by the American Chemical Society, see Annual Standards for Laboratory Chemicals, BDH Ltd., Poole, Dorset, U.K., and the United States Pharmacopeia and National Formulary, U.S. Pharmacopeial Convention, Inc. (USPC), Rockville, MD.

⁷ Obtain metal specimens from Test Engineering, Inc. (TEI), 12718 Cimarron Path, San Antonio, TX 78249-3423.

⁸ The sole source of supply of the apparatus known to the committee at this time is noted in the adjoining footnote. If you are aware of alternative suppliers, please provide this information to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee,¹ which you may attend.

⁹ Suitable abrasive paper meeting these specifications is included with the metal specimens when the specimens are ordered.

¹⁰ Contrad 70 is available from Decon Laboratories, Inc., 460 Glennie Circle, King of Prussia, PA 19406, (800) 332–6647.
