About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee, ...). It also gives information on projects, replaced and withdrawn publications.

IEC online collection - oc.iec.ch

Discover our powerful search engine and read freely all the publications previews. With a subscription you will always have access to up to date content tailored to your needs.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22 000 terminological entries in English and French, with equivalent terms in 18 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

SENSING DEVICES FOR NON-INTRUSIVE LOAD MONITORING (NILM) SYSTEMS

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

IEC TS 63297 has been prepared by IEC technical committee 85: Measuring equipment for electrical and electromagnetic quantities. It is a Technical Specification.

The text of this Technical Specification is based on the following documents:

Draft	Report on voting
85/727/DTS	85/750/RVDTS

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this Technical Specification is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/standardsdev/publications.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- transformed into an International standard,
- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

iTeh STANDARD PREVIEW (standards.iteh.ai)

[IEC TS 63297:2021](#)

<https://standards.iteh.ai/catalog/standards/sist/d7b366c0-0fcc-4047-8dec-9c16693860f5/iec-ts-63297-2021>

INTRODUCTION

Non-intrusive load monitoring (NILM), or non-intrusive appliance and load monitoring (NIALM), is a process for providing estimated energy usage, e.g. by type of use (heating, cooling, etc.) or type of appliance (microwave, etc.) based on load signatures at a single point in the installation.

NILM systems can be used to survey the specific uses of electrical power in homes, buildings or industrial areas (see Figure 1).

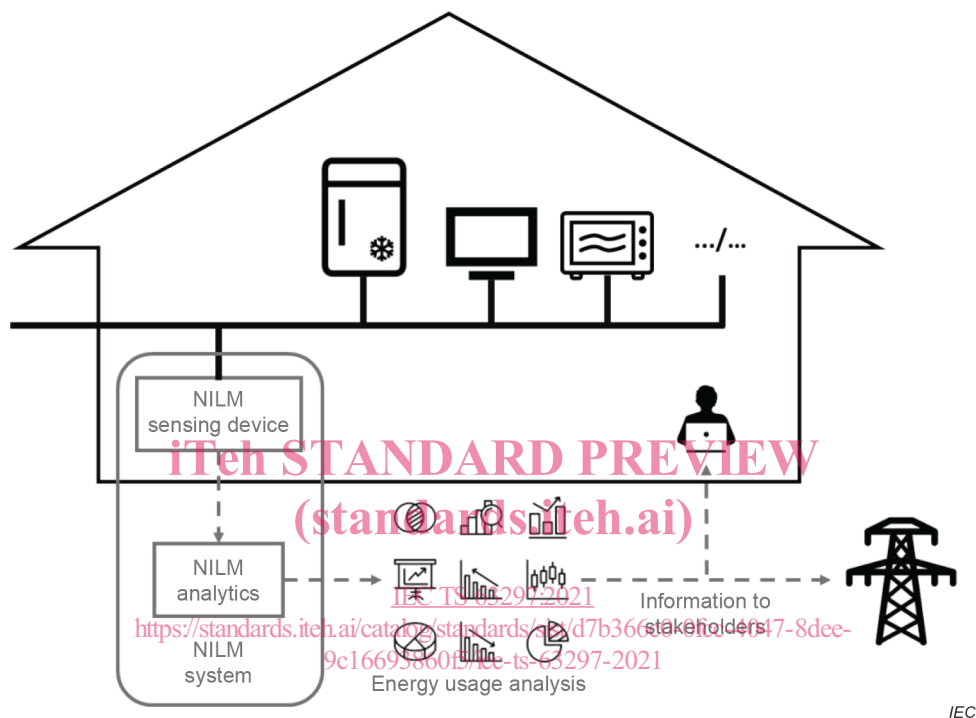

Figure 1 – Principle of non-intrusive load monitoring (NILM)

At the moment, NILM systems are essentially used in AC distribution networks, but DC networks are not excluded.

SENSING DEVICES FOR NON-INTRUSIVE LOAD MONITORING (NILM) SYSTEMS

1 Scope

This Technical Specification is an attempt to provide classification of NILM sensing devices for use in NILM systems, according to the state of the art of NILM technologies.

The classification of NILM analytics and NILM systems, as well as performance indicators for NILM systems, can be considered in the future.

NILM systems produce estimated disaggregation into energy usages. When accurate measurement and analysis of energy consumption and/or other electrical parameters is needed (e.g. for monitoring the electrical installation), systems based on standardized measuring devices (e.g. PMD, PQI or meters) are used.

NOTE Standardized measuring devices have guaranteed accuracy over a specified range and have limited deviations in presence of influence quantities (temperature, frequency deviations, etc.) in addition to safety and constructional requirements. See Annex C for more information.

2 Normative references

There are no normative references in this document.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1

electrical parameter

electrical quantity to be measured or estimated

EXAMPLE RMS value of current, RMS value of voltage, active power, reactive power, harmonics, power quality related parameters, etc.

3.2

estimated value

value of an electrical parameter (e.g. current, power, energy related to a specific usage) produced by a NILM sensing device or a NILM system

Note 1 to entry: Estimated values are typically less accurate than values measured with standardized measuring devices (e.g. PMD, PQI, meters).

3.3

measured value

value of an electrical parameter (e.g. current, power, energy related to a specific usage) produced by a measuring device complying with an electrical measurement standard

Note 1 to entry: Examples of measuring devices complying with an electrical measurement standard include PMD, PQI and meters.

3.4

load signature

pattern in the data produced by a NILM sensing device that can be attributed to a specific type of load or energy usage

3.5

non-intrusive load monitoring

NILM

process for providing estimated categorization of energy usage based on load signatures obtained at a single point in the installation

3.6

NILM analytics

process for analysing data produced by a NILM sensing device and providing information about energy usage

Note 1 to entry: NILM analytics can be performed within the NILM sensing device and/or in the cloud.

3.7

NILM sensing device

NSD

device connected to the electrical installation and producing data to be used by NILM analytics

3.8

NILM system

combination of a NILM sensing device and NILM analytics

3.9

power metering and monitoring device

PMD

combination in one or more devices of several functional modules dedicated to metering and monitoring electrical parameters in energy distribution systems or electrical installations, used for applications such as energy efficiency, power monitoring and network performance

Note 1 to entry: Under the generic term “monitoring” are also included functions of recording, alarm management, etc.

Note 2 to entry: PMDs have a known measurement uncertainty over a specified measurement range and are robust to influence quantities and industrial environments

[SOURCE: IEC 61557-12:2018, 3.1.1, modified – Note 2 to entry has been modified and Note 3 to entry has been deleted]

3.10

power quality instrument

PQI

instrument complying with IEC 62586-1 whose main function is to measure, record and possibly monitor power quality parameters in power supply systems, and whose measuring methods (class A or class S) are defined in IEC 61000-4-30

Note 1 to entry: PQIs have a known measurement uncertainty over a specified measurement range and are robust to influence quantities and industrial environments. They often also have transient event detection and waveform capture capabilities.

[SOURCE: IEC 62586-1:2017, 3.1.1, modified – A reference to IEC 62586-1 and Note 1 to entry have been added]

3.11

gapless measurement

measurement technique where the measurement is performed continuously without gap, that is, using contiguous measurement windows

Note 1 to entry: For digital techniques and for a given sampling rate, no sample shall be missing in the measurement processing.

Note 2 to entry: When gapless measurement techniques are used, no assumption is made regarding the stability of the signal, as opposed to non-gapless measurement techniques, where the signal is considered to be stable during the time where no measurement is done.

4 Elements of a NILM system

4.1 General

A NILM system comprises (see Figure 2):

- a NILM sensing device (NSD) connected to the electrical installation and producing data relevant for load signature identification;
- NILM analytics using the data output from the NSD and producing information to the users about their energy usage.

Figure 2 – Elements of a NILM system

The performance of the NILM system depends on the characteristics of the NILM sensing device (NSD) and on the characteristics of the NILM analytics. There are a lot of differences between the NILM systems available today. For example:

- NILM systems may use several types of NSD, e.g.
 - a) meter;
 - b) power metering and monitoring devices (PMD);
 - c) power quality instrument (PQI);
 - d) dedicated proprietary hardware;
- Some NILM systems may produce energy usage information over one day, while others may show results on a much shorter time scale;
- Some NILM systems may disaggregate into types of usage, others may disaggregate into types of current using equipment (e.g. appliances), while others may focus on providing behavioural analysis.

NILM analytics may also use data produced by smart devices. Smart devices are devices producing information not related to electrical quantities, e.g. position sensors, motion sensors, temperature control equipment, etc.

4.2 NILM sensing device

A NILM sensing device (NSD) is a device connected to the electrical installation. It produces data that can be used by NILM analytics. Examples of data that may be produced by an NSD include:

- samples of current and/or voltage waveforms;
- features characterizing the current and/or voltage waveforms;
- features related to the high-frequency patterns in the electrical signals;
- estimated values of electrical parameters;
- measured values of electrical parameters.

4.3 NILM analytics

The value of NILM systems is essentially in the analytics and how well they are able to make use of the data produced by the NSD.

NILM analytics are algorithms that analyse the data output by an NSD and produce estimated disaggregated information that can help stakeholders make decisions.

Examples of information that may be produced by NILM analytics are:

- estimated disaggregation of energy consumption into specific usages (heating, refrigeration, entertainment...);
- estimated disaggregation of energy consumption into specific types of appliances (ovens, fridges, pumps...).

NOTE NILM systems produce estimated disaggregation into energy usages. When accurate measurement and analysis of energy consumption and/or other electrical parameters is needed (e.g. for monitoring the electrical installation), systems based on standardized measuring devices (e.g. PMDs or meters) are used.

5 Classification of NILM sensing devices (NSD)

5.1 General

A NILM sensing device (NSD) is a gateway between the physical electrical installation and the world of analytics. In order to operate efficiently, NILM algorithms need to know the type of data they are to process. The behaviour of the NSD depends on several characteristics (see Figure 3).

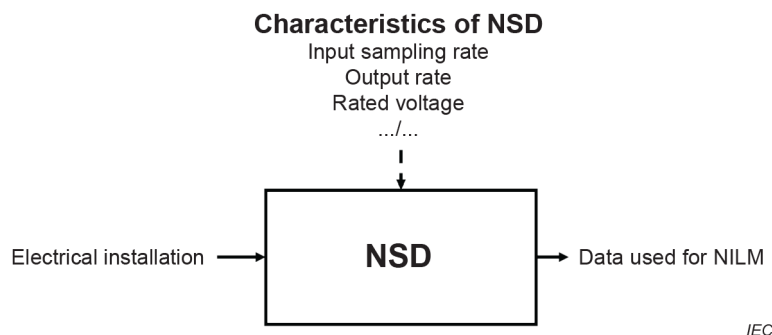

Figure 3 – Component view of a NILM sensing device (NSD)

To facilitate the development of NILM analytics, it is useful to specify the characteristics of NILM sensing devices, for easier selection and comparison.
