About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee, ...). It also gives information on projects, replaced and withdrawn publications.

IEC Products & Services Portal - products.iec.ch

Discover our powerful search engine and read freely all the publications previews. With a subscription you will always have access to up to date content tailored to your needs.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22 300 terminological entries in English and French, with equivalent terms in 19 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

NANOMANUFACTURING – KEY CONTROL CHARACTERISTICS –**Part 2-5: Carbon nanotube materials – Mass density of vertically-aligned carbon nanotubes: X-ray absorption method**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

IEC TS 62607-2-5 has been prepared by IEC technical committee 113: Nanotechnology standardization for electrotechnical products and systems. It is a Technical Specification.

The text of this Technical Specification is based on the following documents:

Draft	Report on voting
113/674/DTS	113/696/RVDTS

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this Technical Specification is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/publications.

A list of all parts in the IEC 62607 series, published under the general title *Nanomanufacturing – Key control characteristics*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The "colour inside" logo on the cover page of this document indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

Vertically-aligned carbon nanotubes (VACNTs) are array structures, in which nanotubes are oriented in the perpendicular direction to a substrate surface. VACNTs are useful in many electronic device applications such as field-emission devices, gas and biological sensors, thermal interface materials, supercapacitors, and so on. Chemical vapour deposition (CVD) is one of the common methods for the synthesis of VACNTs, where CNTs can be grown in the presence of metal catalysts, via thermal decomposition of hydrocarbon sources such as methane, ethylene, acetylene, ethanol, and so on.

Physical (electrical, thermal, etc.) properties of VACNT films really depend on their density, which is reflected by distribution and alignment behaviours of individual CNTs. The mass density of nanotubes in VACNT samples was evaluated in various ways. The first choice is measuring the sample mass gain, which is successively divided by the height and the area of the VACNT samples for obtaining density values. However, this mass gain method is a destructive method, and is effective only if the mass of CNTs can be measured with a microbalance, so that the mass density can be estimated from the mass gain during the CVD growth. The second method is counting the number of CNTs in scanning electron microscope (SEM) or transmission electron microscope (TEM) images. However, this counting method is less reliable when the nanotubes are not grown straight on the substrate and the density is low. Liquid-induced compaction can compact the VACNT samples to a maximum density with wetting or drying process of alcohols. However, these methods are destructive analyses (except for SEM) and are not designed for incorporating the wide distribution in size and alignment of nanotubes observed in realistic VACNT samples. Hence, there is strong demand for the development of new reliable methods for evaluating density in VACNTs.

In this context, an X-ray absorption method is proposed as a standard protocol for evaluating density of VACNTs. X-rays can transmit through the film parallel to the substrate surface, and the transmitted X-rays are detected by a high-resolution X-ray imaging apparatus. The observed X-ray projection images can enable the substrate, VACNT film, and air regions to be identified easily. The film density can be calculated from the measured X-ray transmittance of the film. This method is an effective and versatile technique of nondestructive analysis for VACNT film density.

NANOMANUFACTURING – KEY CONTROL CHARACTERISTICS –

Part 2-5: Carbon nanotube materials – Mass density of vertically-aligned carbon nanotubes: X-ray absorption method

1 Scope

This part of IEC 62607 specifies the protocols for determining the mass density of vertically-aligned carbon nanotubes (VACNTs) by X-ray absorption method. This document outlines experimental procedures, data formats, and some case studies. These protocols are applicable to VACNT films with thickness larger than several tens of micrometres. There are no limitations in materials for substrate.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

There are no normative references in this document.

3 Terms, definitions, and abbreviated terms

3.1 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1.1

carbon nanotube

nanotube composed of carbon

[SOURCE: ISO/TS 80004-3:2020 [1], 3.3.3, modified – Note 1 to entry has been deleted.]

3.1.2

single-walled carbon nanotube

SWCNT

carbon nanotube consisting of a single cylindrical graphene layer

[SOURCE: ISO/TS 80004-3:2020, 3.3.4, modified – The term "single-wall carbon nanotube" and Note 1 to entry have been deleted.]

3.1.3
multi-walled carbon nanotube
MWCNT

carbon nanotube composed of nested, concentric or near-concentric graphene layers with interlayer distances similar to those of graphite

[SOURCE: ISO/TS 80004-3:2020, 3.3.6, modified – The term "multiwall carbon nanotube" and Note 1 to entry have been deleted.]

3.1.4
vertically-aligned carbon nanotubes
VACNTs

carbon nanotube bundle grown in the perpendicular direction to a substrate surface

3.2 Abbreviated terms

- CVD chemical vapour deposition
- SEM scanning electron microscope

4 Measurement of mass density of vertically-aligned carbon nanotubes with X-ray absorption method

4.1 General

X-ray is well known for its high penetrating power and has been widely used for nondestructive inspection of various materials. In addition, the absorption (transmission) rate of every element has been extensively studied for a long time and tabulated with very good accuracy. Hence, when the elemental composition of the material is known, the density of the thin film material can be calculated from the measured transmittance of X-rays in a nondestructive way.

4.2 Measurement principle

Figure 1 presents the principle for measuring density of VACNT film by X-ray absorption method. The absorption of X-rays by the VACNT film is expressed as follows: [2]¹

$$I = I_0 \exp[-\mu_{\rho}(E, Z)\rho l] \tag{1}$$

where I_0 and I are incident and transmitted X-ray intensity, respectively. μ_{ρ} is the mass attenuation coefficient of the material, ρ is the mass density of the sample, and l is the path length of X-ray. μ is a physical parameter as a function of the X-ray energy (E) and the elemental composition (Z).

IEC

Figure 1 – Measurement principle of X-ray absorption method

¹ Numbers in square brackets refer to the Bibliography.

4.3 Description of measurement equipment and apparatus

In order to measure absorption of the VACNTs, the incident X-ray should be completely parallel to the substrate and the spatial resolution of the measurement should be high enough to detect transmitted X-ray signals separately from substrate, VACNT, and outer surface areas [3]. The spatial resolution of the present method Δ_R is determined by the convolution of beam divergence factor and spatial resolution of the X-ray detector as follows:

$$\Delta_R = \sqrt{[\delta_B (l + d_{SD})]^2 + R^2}, \quad (2)$$

where δ_B is the X-ray beam divergence, l is the path length of the sample, d_{SD} the distance from the substrate to the X-ray detector, and R is the spatial resolution of the X-ray detector, as depicted in Figure 2.

Figure 2 – Parameters determining the spatial resolution of X-ray absorption method

4.4 Sample preparation

VACNT films are usually prepared by using a variety of chemical vapour deposition (CVD) methods such as plasma-enhanced CVD [4], thermal CVD [5], water-assisted CVD [6], and so on. At first, metal catalyst nanoparticles are deposited onto a substrate by physical vapour deposition methods (e.g. sputtering, thermal deposition, and electron-beam deposition) or chemical processes including reduction of metal oxides or oxides solid solutions. After that, the substrate is put into a CVD chamber and heated to a certain CNT growth temperature of several hundred degrees Celsius, followed by the introduction of hydrocarbon sources (e.g. methane, ethylene, acetylene, or alcohols) and process gases (e.g. nitrogen, hydrogen, or ammonia) into the reaction chamber. Then, VACNT films are grown in the presence of metal catalysts via thermal decomposition of hydrocarbon sources. An actual example of VACNT film preparation using CVD is given in Annex A.

4.5 Thickness measurement with X-ray absorption method

Figure 3 shows an X-ray projection image of VACNTs grown on Si substrate, which is a representative result obtained with X-ray absorption method. Three regions can be clearly recognized: substrate, VACNT film, and air. For example, the thickness of the VACNT film presented in Figure 3 can be measured to be approximately 120 μm from the image. Specific stripe patterns can be seen along the air–film interface in Figure 3, which are derived from refraction of X-ray photons near the edge of the film surface due to the difference in X-ray refractive indices between VACNT and air.
