

Designation: ~~C1104/C1104M – 13a~~ C1104/C1104M – 19

## Standard Test Method for Determining the Water Vapor Sorption of Unfaced Mineral Fiber Insulation<sup>1</sup>

This standard is issued under the fixed designation C1104/C1104M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

### 1. Scope

1.1 This test method covers the determination of the amount of water vapor sorbed by mineral fiber insulation exposed to a high-humidity atmosphere. This test method is applicable only to fibrous base material and binder. The results obtained by this test method cannot be used in describing faced products, since the facing is not tested by using this test method.

1.2 The water vapor sorption characteristics of materials may be affected by conditions such as elevated temperatures or chemical exposures. Values obtained as a result of this test method may not adequately describe the water vapor sorption characteristics of materials subjected to these conditions.

1.3 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.5 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

### 3. Terminology

3.1 *Definitions of Terms Specific to This Standard:*

3.1.1 The term sorption has been adopted for this test method, since mineral fiber insulation may *absorb* water within its bulk when viewed macroscopically, while it *adsorbs* water onto individual fibers on a microscopic scale.

(1) *sorption*—refers to the taking up and holding of matter by other matter by various processes such as absorption and adsorption.

(2) *absorption*—refers to the taking up of matter in-bulk by other matter; for example, the penetration of substances into the bulk of another solid or liquid.

(3) *adsorption*—refers to surface retention or adhesion of an extremely thin layer of molecules to the surfaces of solids or liquids with which they are in contact.

<sup>1</sup> This test method is under the jurisdiction of Committee C16 on Thermal Insulation and is the direct responsibility of Subcommittee C16.33 on Insulation Finishes and Moisture.

Current edition approved Nov. 1, 2013; Sept. 1, 2019. Published December 2013; September 2019. Originally approved in 1988. Last previous edition approved in 2013 as C1104/C1104M – 13; C1104/C1104M – 13a. DOI: 10.1520/C1104\_C1104M-13A, 10.1520/C1104\_C1104M-19.

#### 4. Summary of Test Method

4.1 The insulation is dried to a constant weight and exposed to a high-humidity atmosphere for 96 h. The amount of water sorbed from the vapor phase is the difference in specimen weights, and is expressed in either weight or volume percent.

#### 5. Significance and Use

5.1 The sorption of water can result in an increase in weight and a resultant potential degradation of the properties of the insulation.

#### 6. Apparatus

- 6.1 *Air-circulating oven*, capable of maintaining a temperature between 102° and 121°C [215° and 250°F].
- 6.2 *Desiccator*, with calcium chloride as a desiccant.
- 6.3 *Scale*, accurate to  $\pm 0.1\%$  of specimen weight.
- 6.4 *Environmental test chamber*, capable of maintaining a temperature of  $49 \pm 2^\circ\text{C}$  [ $120 \pm 3^\circ\text{F}$ ] and a relative humidity of  $95 \pm 3\%$ .
- 6.5 *Steel rule*, graduated in 1 mm or 0.05 in. intervals with depth gauge as described in Test Methods **C167**.
- 6.6 *Sealable polyethylene sample bags* of a size large enough to accommodate the test specimens (for blanket, board, or pipe thermal insulations).
- 6.7 *Non-water-sorbing, non-corrosive tray* with tight-fitting lid measuring at least 15 by 15 cm [6 by 6 in.] (for loose-fill insulations).

#### 7. Sampling and Test Specimens

7.1 Three specimens shall be tested, unless otherwise stated in the appropriate material specification. These are to be obtained from one representative package of insulation. Sampling techniques should be in accordance with Practice **C390**.

7.2 For blanket and board products, the test specimen shall be of a size that can be conveniently tested in the environmental chamber, but not smaller than 15 by 15 cm [6 by 6 in.] by the full sample thickness. For pipe insulation products, use a 15 cm [6 in.] length and as much of the circumference as can be conveniently tested. For loose-fill products, the test specimen shall consist of sufficient quantity of the material to fill a preweighed container measuring at least 15 by 15 cm [6 by 6 in.], to a nominal depth at its nominal density.

7.3 The insulation shall be tested without facing or jacketing, unless otherwise agreed upon by the purchaser and supplier, or unless otherwise specified by the appropriate material specification.

#### 8. Procedure A, for Blanket, Board, and Pipe Insulation Products

8.1 If it is necessary to determine volume percent, measure the dimensions and calculate the density of the specimens using **8.1.1**, **8.1.2**, or **8.1.3**.

8.1.1 For blanket products, measure the length and width of the specimens using a steel rule. Measure the weight of the specimens. Measure the thickness of the specimens by means of the depth gage as stated in Test Method **C167**. Calculate the density of the specimens.

8.1.2 For board products, measure the dimensions of the specimens using the test methods stated in Test Method **C303**.

8.1.3 For pipe products, measure the dimensions of the specimens using the test methods stated in Test Method **C302**.

8.1.4 Calculate the volume of the specimens. If requested, the volume may be based on the nominal thickness rather than the measured thickness, but this must be included in the report.

8.2 Determine the moisture-free weight of each specimen in the manner described in **8.2.1**.

8.2.1 Weigh the specimen. Place the specimen in an air-circulating oven at a temperature of ~~102°~~102 to 121°C [~~215°~~215 to 250°F] for a minimum of 2 h. (See **Note 1**.) Cool the specimen to room temperature in a desiccator and reweigh. Wait a minimum of 10 min then weigh the specimen again. Repeat the process until successive weighings agree to within 0.2 % of the specimen weight obtained in the latest weighing. Record this weight as the moisture-free weight.

**NOTE 1**—When drying at the specified temperature has been shown to adversely affect the insulation, the specimen may be dried to moisture-free weight in a desiccator at room temperature. However, the drying time between successive weighings should then be extended to at least 24 h.

8.3 Bring the specimens to a uniform temperature in an oven of not less than 60°C [140°F] and then transfer to the environmental chamber. Either suspend the specimens or place on a grid within the chamber in order to ensure air circulation around the specimens. Protect the specimens from condensate dripping from the chamber ceiling by using a slanting false roof immediately above the specimens.

8.4 Allow the specimens to remain in the environmental chamber for  $96 \pm 4$  h at a temperature of  $49^\circ \pm 2^\circ\text{C}$  [ $120^\circ \pm 3^\circ\text{F}$ ] and at a relative humidity of  $95 \pm 3\%$ . Then place each specimen in its own pre-weighed sample bag, seal the bag, and remove from
