About the IEC
The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications
The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform
The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee, …). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished
Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc
If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

IEC Products & Services Portal - products.iec.ch
Discover our powerful search engine and read freely all the publications previews. With a subscription you will always have access to up to date content tailored to your needs.

Electropedia - www.electropedia.org
The world's leading online dictionary on electrotechnology, containing more than 22 300 terminological entries in English and French, with equivalent terms in 19 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

A propos de l'IEC
La Commission Electrotechnique Internationale (IEC) est la première organisation mondiale qui élabore et publie des Normes internationales pour tout ce qui a trait à l'électricité, à l'électronique et aux technologies apparentées.

A propos des publications IEC
Le contenu technique des publications IEC est constamment revu. Veuillez vous assurer que vous possédez l’édition la plus récente, un corrigendum ou amendement peut avoir été publié.

Recherche de publications IEC - webstore.iec.ch/advsearchform
La recherche avancée permet de trouver des publications IEC en utilisant différents critères (numéro de référence, texte, comité d’études, …). Elle donne aussi des informations sur les projets et les publications remplacées ou retirées.

IEC Just Published - webstore.iec.ch/justpublished
Restez informé sur les nouvelles publications IEC. Just Published détaille les nouvelles publications parues. Disponible en ligne et une fois par mois par email.

Service Clients - webstore.iec.ch/csc
Si vous désirez nous donner des commentaires sur cette publication ou si vous avez des questions contactez-nous: sales@iec.ch.

IEC Products & Services Portal - products.iec.ch
Découvrez notre puissant moteur de recherche et consultez gratuitement tous les aperçus des publications. Avec un abonnement, vous aurez toujours accès à un contenu à jour adapté à vos besoins.

Electropedia - www.electropedia.org
Le premier dictionnaire d'électrotechnologie en ligne au monde, avec plus de 22 300 articles terminologiques en anglais et en français, ainsi que les termes équivalents dans 19 langues additionnelles. Egalement appelé Vocabulaire Electrotechnique International (IEV) en ligne.

FIBRE OPTIC ACTIVE COMPONENTS AND DEVICES – TEST AND MEASUREMENT PROCEDURES –

Part 6: Universal mezzanine boards for test and measurement of photonic devices

FOREWORD

1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
6) All users should ensure that they have the latest edition of this publication.
7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

IEC 62150-6 has been prepared by subcommittee SC 86C: Fibre optic systems and active devices of IEC technical committee 86: Fibre optics. It is an International Standard.

The text of this International Standard is based on the following documents:

Draft	Report on voting
86C/1721/CDV	86C/1752/RVC

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this International Standard is English.

A list of all parts in the IEC 62150 series, published under the general title *Fibre optic active components and devices – Test and measurement procedures*, can be found on the IEC website.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/publications.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The "colour inside" logo on the cover page of this document indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

This document defines a generic electro-optic mezzanine board for the test and measurement of micro-optical and micro-photonic devices, including a wide diversity of photonic integrated circuit (PIC) technologies including, but not limited to, transceivers, switches, sensors, neuromorphic networks, LiDAR and quantum integrated circuits. The board size and shape would allow two mezzanine boards to be mounted, side-by-side, on a larger Eurocard form factor daughtercard, which itself can be docked into and powered from a backplane system. Alternatively, each mezzanine board can be operated alone, for example on a lab bench powered from a bench supply.

The purpose of this generic mezzanine board concept is to allow like-for-like comparative characterisation of devices under test (DUTs) with respect to one another and to measure the performance of DUTs within larger test environments, relevant to their targeted application, such as data centre systems, high performance computers, automotive or 5G cabinets. The mezzanine board PCB will be designed to accommodate very high-speed electronic signals and a high-speed electronic signal interface to allow external test equipment such as test pattern generators, bit error rate testers and communication signal analysers to drive the device under test (DUT).

This approach will be instrumental in accelerating commercial adoption of micro-photonic devices as they will provide a common benchmark, against which to evaluate the true performance of a DUT. For example, power consumption is an increasingly important figure of merit for optical micro-transceivers in ICT systems; however, the declared values of power consumption as interpreted by the developer often do not reflect the true power consumption of a device under test in operation. The mezzanine board will therefore include provision for a smaller detachable power distribution and sensor mezzanine board allowing multiple tuneable voltages to be provided to the device under test and real-time current or power measurement for each voltage.

Variants of these mezzanine boards have been successfully developed and adopted within the European research and development projects European FP7 project PhoxTrot [1][1], European H2020 Nephele [2] and European H2020 COSMICC [3]. Annex A provides an introduction to these projects.

1 Numbers in square brackets refer to the Bibliography.

FIBRE OPTIC ACTIVE COMPONENTS AND DEVICES – TEST AND MEASUREMENT PROCEDURES –

Part 6: Universal mezzanine boards for test and measurement of photonic devices

1 Scope

This part of IEC 62150 specifies a generic mezzanine board system to support test and measurement of devices based on micro-optical and micro-photonic technologies, including but not limited to photonic integrated circuit (PIC) devices.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 60050-731, *International Electrotechnical Vocabulary – Part 731: Optical fibre communication* (available at www.electropedia.org)

IEC 62150-1, *Fibre optic active components and devices – Test and measurement procedures – Part 1: General and guidance*

IEC TR 63072-1, *Photonic integrated circuits – Part 1: Introduction and roadmap for standardization*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in IEC 60050-731, IEC 62150-1, IEC TR 63072-1 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at http://www.electropedia.org/
- ISO Online browsing platform: available at http://www.iso.org/obp

3.1
mezzanine board
electronic, optical, or electro-optical printed circuit board designed to be docked onto a larger board such that the surfaces of the mezzanine board and larger board are parallel

3.2
photonic integrated circuit
PIC
integrated circuit that contains optical structures to guide and process optical signals

Note 1 to entry: See IEC TR 63072-1.

3.3
device under test
DUT
single component or combination of components as defined to be tested

4 Mezzanine board requirements

4.1 Functional description

This document specifies three categories of mezzanine boards:

- half-width mezzanine test board 1 (M1);
- full-width mezzanine test board 2 (M2);
- power distribution and sensor board (PDS).

Figure 1 shows the outline shapes of these three mezzanine boards with electric power and other low-speed electric connectors on the top and bottom surfaces.

This document defines the outline boundary of the three boards, as shown by the solid thick line in Figure 1, but the designer is free to adopt any shape within the defined boundary, as long as it does not interfere with the positions of the power and low-speed connectors on the top and/or bottom surfaces. M2 is shown with optional example cut-outs along the edges. The purpose of such cut-outs typically is to allow the user to access components on the underlying host board over which the mezzanine board is attached. For example, during operation, the user may require transient access to connectors on the underlying host board for low-speed diagnostic read-outs from the PDS.

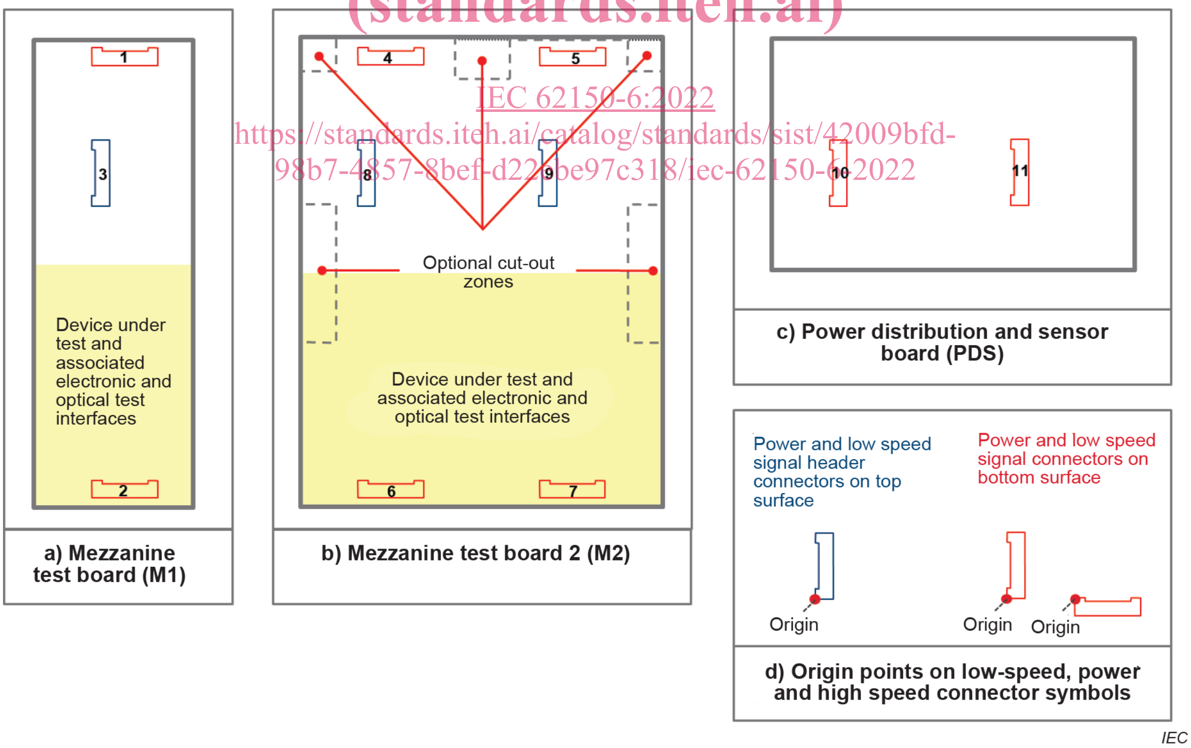

Figure 1 – Outlines of mezzanine test boards

M1 and M2 are mezzanine test boards with areas assigned for micro-optical or micro-photonic devices under test (DUTs) and the associated electronic and optical test interfaces.

For example, the DUT on a mezzanine test board (M1 or M2) could be an experimental photonic integrated circuit (PIC) optical transceiver. The associated electronic test interface could be a high RF electronic signal header connector array through which high-speed test signals generated from an external electronic signal pattern generator could be conveyed to the optical transmit section of the transceiver DUT and through which electronic high-speed signals generated from the optical receiver section of the transceiver DUT could be conveyed off the mezzanine test board to an external electronic communications signal analyser or bit error rate tester. The associated optical test interface could be an optical array connector attached by an optical fibre ribbon to the optical transceiver DUT through which high-speed optical signals from an external optical signal pattern generator could be conveyed to the optical receiver section of the transceiver DUT and through which optical high-speed optical signals generated from the optical transmit section of the transceiver DUT could be conveyed off the mezzanine test board to an external optical communications signal analyser or optical bit error rate tester.

The PDS is a power distribution and sensor board that attaches onto a full width mezzanine card (M1) or across one or two half-width mezzanine test boards (M1) and provides the requisite voltage or separate voltages to the device under test on its host mezzanine test board or boards. In addition, the PDS provides a current sensor for each voltage provided to the mezzanine test board(s), allowing the power consumption of the corresponding DUT to be measured. Typically, the current sensor will communicate the readings of current in real-time across a low-speed signal interface, for example a serial wire interface such as I2C. Figure 2 shows a PDS attaching to an M2 board.

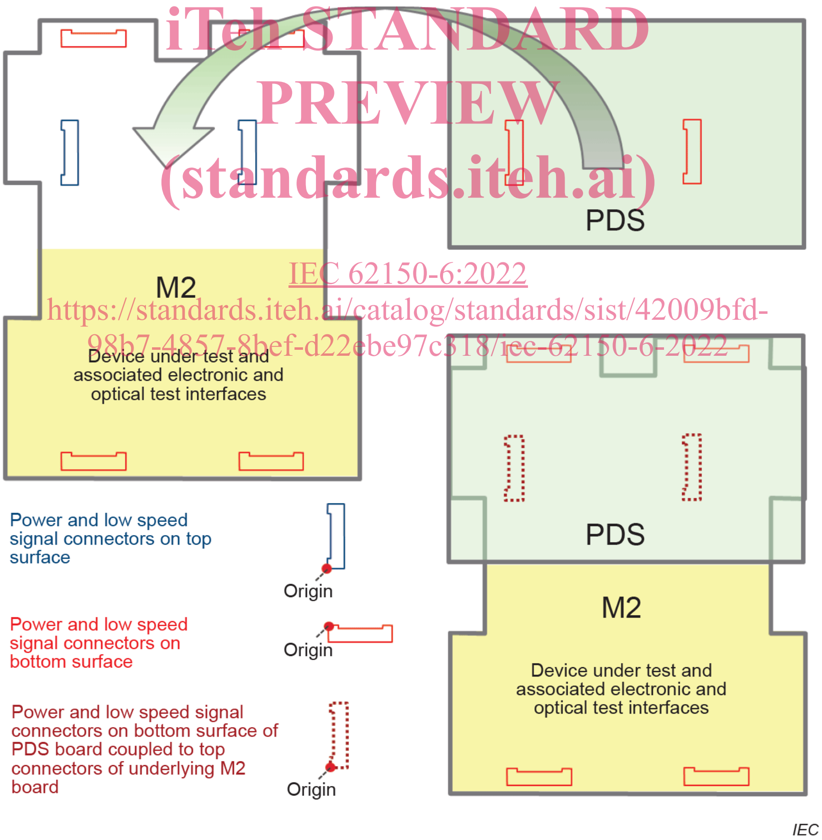

Figure 2 – Attachment of PDS onto M2 board

4.2 Critical dimensions

This document defines the outline board dimensions and the relative positions of the origin points of the power and low-speed signal connectors on the top and bottom surfaces with respect to one another and the board origin points. The connector origin points are always defined by the centre position of pin 1. In Figure 2, as well as in Figure 3 to Figure 10, the connector origin points are represented by a corner of the package shape itself, but as connectors may vary, the package sizes may also vary.

Figure 3 shows the relative positions of the origin points of the power and low-speed signal connectors on top and bottom surfaces and the mezzanine board origin point on M1.

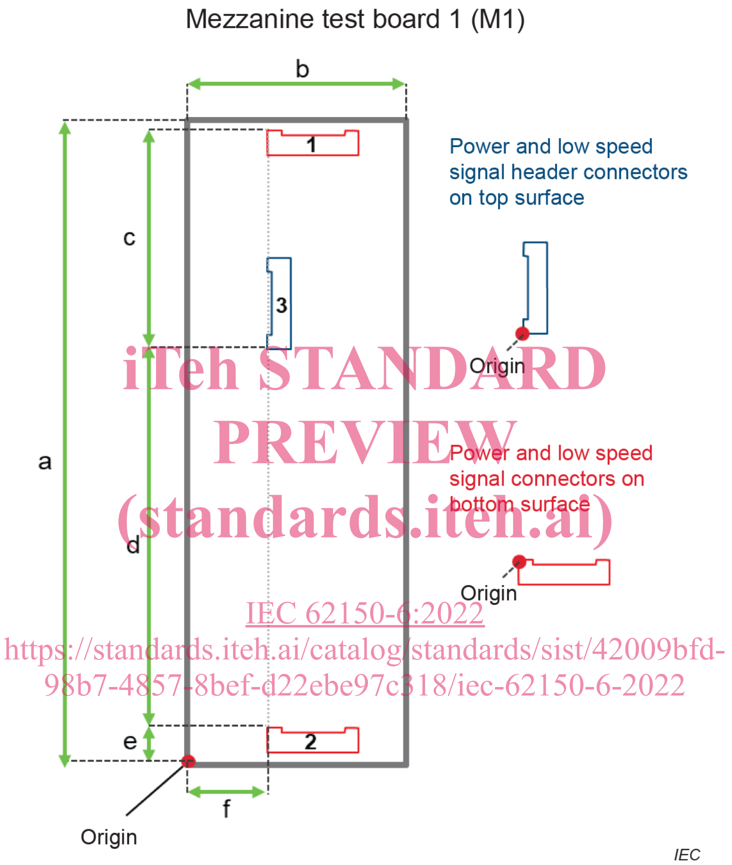

Figure 3 – Mezzanine board 1 (M1) – Relative positions of power and low speed signal connectors on top and bottom surfaces and mezzanine board origin

Figure 4 shows the relative positions of the origin points of the power and low-speed signal connectors on top and bottom surfaces and the mezzanine board origin point on M2.

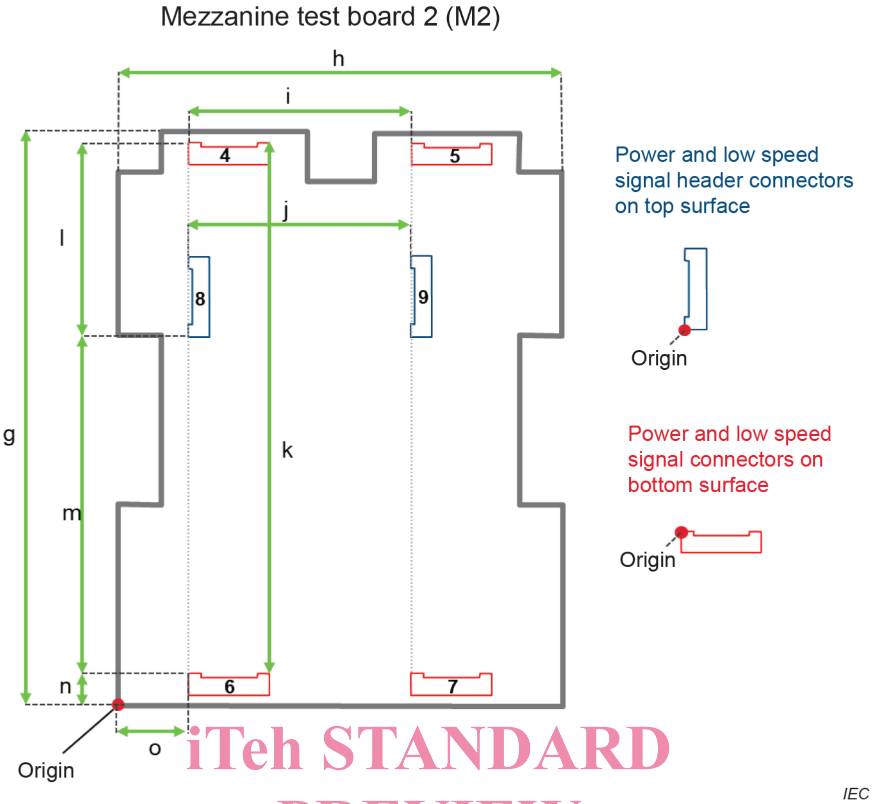

Figure 4 – Mezzanine board 2 (M2) – Relative positions of power and low speed signal connectors on top and bottom surfaces and mezzanine board origin

Figure 5 shows the relative positions of power and low-speed signal header connectors on bottom surfaces and the mezzanine board origin point on the PDS.

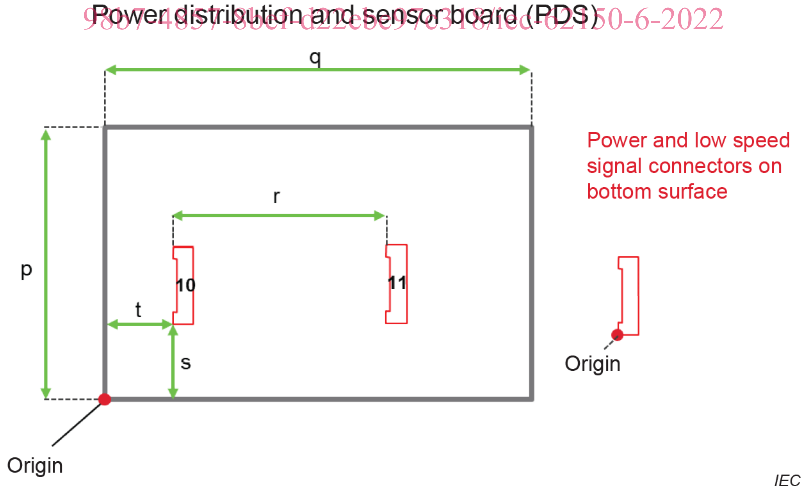

Figure 5 – Power distribution and sensor board (PDS) – Relative positions of power and low speed signal connectors on bottom surfaces and mezzanine board origin

Table 1 shows the values of the critical relative dimensions of the board outline and relative positions of the power and low-speed signal connectors on the top and bottom surfaces with respect to one another and the board origin points.

Table 1 – Critical relative dimensions

Designation	**Description**	**Value** mm
Mezzanine board 1 (M1)		
a	Length of M1	145
b	Width of M1	Maximum 53
c	Vertical distance between bottom connector 1 and top connector 3	48
d	Vertical distance between top connector 3 and bottom connector 2	86,35
e	Vertical distance between bottom connector 2 and board origin point	8,25
f	Horizontal distance between bottom connector 2 and board origin point	15
Mezzanine board 2 (M2)		
g	Length of M2	145
h	Width of M2	Maximum 112
i	Horizontal distance between bottom connectors 4 and 5	70
j	Horizontal distance between top connectors 8 and 9	70
k	Vertical distance between bottom connectors 4 and 6	134
l	Vertical distance between bottom connector 4 and top connector 8	48
m	Vertical distance between top connector 8 and bottom connector 6	86,35
n	Vertical distance between bottom connector 6 and board origin point	8,25
o	Horizontal distance between bottom connector 6 and board origin point	15
Power distribution and sensor board (PDS)		
p	Length of PDS	112
q	Width of PDS	Maximum 145
r	Horizontal distance between bottom connectors 10 and 11	70
s	Vertical distance between bottom connector 10 and board origin point	14,75
t	Horizontal distance between bottom connector 10 and board origin point	16,5

4.3 Daughtercard and extended system

The M1 and M2 boards populated with PDS can be used stand-alone, for example on a lab bench powered by an external power supply.

Alternatively, the M1 and M2 boards can be incorporated into a wider rack-scale test system, whereby they are mounted onto a test daughtercard, and the test daughtercard, in turn, could be electro-optically plugged into the backplane of the test enclosure.

The M1 and M2 board dimensions were designed to allow either four M1 or two M2 boards to be populated onto a daughtercard with "extended double Eurocard form factor", which is a common industrial form factor appropriate for deployment in rack-scale enclosures.

Figure 6 shows the outline dimensions of an extended double Eurocard form factor daughtercard with example electrical edge connectors and example cut-outs to accommodate optical backplane connectors.
