About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee, ...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

IEC Products & Services Portal - products.iec.ch

Discover our powerful search engine and read freely all the publications previews, graphical symbols and the glossary. With a subscription you will always have access to up to date content tailored to your needs.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22 500 terminological entries in English and French, with equivalent terms in 25 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

POWER QUALITY MANAGEMENT –

Part 3: User characteristics modelling

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.

- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications
 - 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
 - 9) IEC draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). IEC takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, IEC had not received notice of (a) patent(s), which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at https://patents.iec.ch. IEC shall not be held responsible for identifying any or all such patent rights.

IEC 63222-3 has been prepared by IEC technical committee 8: System aspects of electrical energy supply. It is a Technical Specification.

The text of this Technical Specification is based on the following documents:

Draft	Report on voting
8/1690/DTS	8/1702/RVDTS

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this Technical Specification is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at http://www.iec.ch/standardsdev/publications.

A list of all parts in the IEC 63222 series, published under the general title *Power quality management*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn, or
- revised.

IMPORTANT – The "colour inside" logo on the cover page of this document indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

POWER QUALITY MANAGEMENT -

Part 3: User characteristics modelling

1 Scope

This part of IEC 63222 is intended to provide provisions regarding recognized engineering practices applicable to assess the user's characteristics in power quality predicted assessment. It summarizes the best practice in non-linear, unbalanced, impact and fluctuating loads or generations modelling for power quality disturbance anticipation in public power systems at the planning stage.

This document focuses on frequency-domain modelling for AC power quality analysis in electric power networks, typically in the range up to the 50th harmonic (2,5 kHz in 50 Hz systems or 3 kHz in 60 Hz systems). Unbalance is analyzed in three-phase systems and only negative sequence component is considered. The approach and modelling guidelines provided are valid on the representation of user installations connected to power systems acting as sources of disturbance. Modelling of the network elements is out of the scope of the document.

These guidelines will be valuable in the definition of power quality performance specifications for user equipment. They will also assist users when modelling their installation to assess or demonstrate compliance with the emission limits provided by the system owner/operator and to investigate and specify mitigation measures.

2 Normative references ocument Preview

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- IEC Electropedia: available at https://www.electropedia.org/
- ISO Online browsing platform: available at https://www.iso.org/obp

3.1

power quality

characteristics of the electric current, voltage and frequency at a given point in an electric power system, evaluated against a set of reference technical parameters

[SOURCE: IEC 60050-614:2016, 614-01-01 - The note to entry has been deleted.]

3.2 point of common coupling PCC

point in an electric power system, electrically nearest to a particular load, at which other loads are, or may be, connected

Note 1 to entry: These loads can be either devices, equipment or systems, or distinct network users' installations.

[SOURCE: IEC 60050-614:2016, 614-01-12]

3.3

point of connection

reference point on the electric power system where the user's electrical facility is connected

<u>IEC TS 63222-3:2024</u>

https://[SOURCE: IEC 60050-617: 2009, 617-04-01]83-7fc3-4480-9925-7ad2ebf1d165/iec-ts-63222-3-2024

3.4

system impedance

impedance of the electric power system as viewed from a designated point (e.g. point of common coupling or point of supply)

[SOURCE: IEC 60050-614:2016, 614-01-13]

3.5

short-circuit power

product of the current in the short circuit at a point of a system and a conventional voltage, generally the operating voltage

[SOURCE: IEC 60050-601:1985, 601-01-14]

3.6

RMS value root-mean-square value effective value for a time-dependent quantity, positive square root of the mean value of the square of the quantity taken over a given time interval

[SOURCE: IEC 60050-103:2017, 103-02-03, modified – The notes to entry have been deleted.]

3.7

voltage deviation

difference between the supply voltage at a given instant and the declared supply voltage

[SOURCE: IEC 60050-614:2016, 614-01-04]

3.8

voltage fluctuation

series of voltage changes or a continuous variation of the RMS or peak value of the voltage

Note 1 to entry: Whether the RMS or peak value is chosen depends upon the application, and which is used should be specified.

[SOURCE: IEC 60050-161:1990, 161-08-05]

3.9

flicker

impression of unsteadiness of visual sensation induced by a light stimulus whose luminance or spectral distribution fluctuates with time

[SOURCE: IEC 60050-614:2016, 614-01-28]

3.10

voltage unbalance

condition in a polyphase system in which the RMS values of the phase element voltages (fundamental component), or the phase angles between consecutive phase element voltages, are not all equal

[SOURCE: IEC 60050-614:2016, 614-01-32] + Drovid

3.11

unbalance factor

EC TS 63222-3:2024

in a three-phase system, degree of unbalance expressed by the ratio (in per cent) of the RMS values of the negative sequence component (or the zero sequence component) to the positive sequence component of the fundamental component of the voltage or the electric current

[SOURCE: IEC 60050-614:2016, 614-01-33]

3.12

harmonic order

harmonic number

the integral number given by the ratio of the frequency of a harmonic to the fundamental frequency

[SOURCE: IEC 60050-161:1990, 161-02-19]

3.13

harmonic content

the quantity obtained by subtracting the fundamental component from an alternating quantity

[SOURCE: IEC 60050-161:1990, 161-02-21]

3.14

nth harmonic ratio

ratio of the RMS value of the nth harmonic to that of the fundamental component

[SOURCE: IEC 60050-161:1990, 161-02-20]

3.15 total harmonic ratio THD total harmonic distortion

ratio of the RMS value of the harmonic content to the RMS value of the fundamental component or the reference fundamental component of an alternating quantity

Note 1 to entry: The total harmonic ratio depends on the choice of the fundamental component. If it is not clear from the context which one is used an indication should be given.

Note 2 to entry: The total harmonic ratio can be restricted to a certain harmonic order. This is to be stated.

[SOURCE: IEC 60050-551:2001, 551-20-13, modified – In the term, "factor" has been changed to "ratio", an equivalent term and an admitted term have been added; in the definition, "of an alternating quantity" has been replaced by "value of the fundamental component or the reference fundamental component of an alternating quantity" and note 2 to entry has been added.]

3.16

interharmonic frequency

frequency which is a non-integer multiple of the reference fundamental frequency

[SOURCE: IEC 60050-551:2001, 551-20-06]

3.17

voltage dip

iTeh Standards

sudden voltage reduction at a point in an electric power system, followed by voltage recovery after a short time interval, from a few periods of the sinusoidal wave of the voltage to a few seconds

[SOURCE: IEC 60050-614:2016, 614-01-08]

4 Model category and modelling methodology

/standards.iteh.ai/catalog/standards/iec/c0546383-7fc5-4480-9925-7ad2ebf1d165/iec-ts-63222-3-2024

4.1 Model category used for power quality assessment of distorting installations

Power quality predictive evaluation procedure follows three stages (IEC TR 61000-3-6, IEC TR 61000-3-7, IEC TR 61000-3-13). User characteristics modelling differs with three stages of power quality assessment. For stage 1, no power quality evaluation or modelling is necessary. For stage 2, the simplified calculation method is used to evaluate the impact of equipment. For stage 3, assessment is generally carried out by power system simulation software. Three types of modelling methods are involved in stage 3, including:

- frequency-domain modelling, with respect to simulations for analysis of harmonics, interharmonics and unbalance.
- electromechanical time-domain modelling, with respect to electromechanical transient simulations for analysis of voltage dip/surge, fast voltage variation and flicker.
- electromagnetic time-domain modelling of equipment such as power electronic converter, with respect to electromagnetic transient (EMT) simulations for analysis of harmonics and interharmonics.

NOTE power quality simulations can be carried out based on load flow results in two ways:

- "fast RMS time domain modelling method" for analysis of voltage dip/swell, fluctuation, flicker, etc.
- "frequency domain modelling method" for analysis of harmonics, interharmonics and disturbances > 2 kHz, where all harmonic components are synchronized to fundamental voltages.

4.2 Model structure

4.2.1 Power supply model

To analyze voltage deviation, voltage fluctuation, flicker, and voltage dip, an equivalent power source model is recommended, as in Figure 1. The parameters in the equivalent Thevenin or Norton source circuit is recommended in Table 1. This model can be used to represent background voltage disturbances at point of common coupling (PCC) or point of connection (POC).

- 10 -

Key

- equivalent open-circuit voltage source (case Thevenin) $E_{\rm oc}$
- equivalent short-circuit current source (case Norton) $J_{\rm sc}$
- source impedance in complex values $Z_{\rm r}, Z_{\rm i}$

Figure 1 – Equivalent power source model
