Designation: B210/B210M - 19 B210/B210M - 19a

Used in USNRC-NDT standards

# Standard Specification for Aluminum and Aluminum-Alloy Drawn Seamless Tubes<sup>1</sup>

This standard is issued under the fixed designation B210/B210M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

## 1. Scope\*

- 1.1 This specification<sup>2</sup> covers aluminum and aluminum-alloy drawn seamless tubes in straight lengths and coils for general purpose and pressure applications in alloys (Note 2), tempers, and thicknesses shown in Table 2 [Table 3]. Coiled tubes are generally available only as round tubes with a wall thickness not exceeding 0.083 in. [2.00 mm] and only in non-heat-treatable alloys.
- 1.2 Alloy and temper designations are in accordance with ANSI H35.1/H35.1M. The equivalent Unified Numbering System alloy designations are those of Table 1 preceded by A9, for example, A91100 for aluminum designation 1100 in accordance with Practice E527.
- Note 1—See Specification B483/B483M for aluminum-alloy drawn tubes for general purpose applications; Specification B234 for aluminum-alloy drawn seamless tubes for condensers and heat exchangers; and Specification B241/B241M for aluminum-alloy seamless pipe and seamless extruded tube.

  Note 2—Throughout this specification, use of the term *alloy* in the general sense includes aluminum as well as aluminum alloy.
  - 1.3 For acceptance criteria for inclusion of new aluminum and aluminum alloys in this specification, see Annex A2.
- 1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.
- 1.5 This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.

### 2. Referenced Documents

- 2.1 The following documents of the issue in effect on date of material purchase form a part of this specification to the extent referenced herein:

H35.2 [H35.2M] Dimensional Tolerances for Aluminum Mill Products

2.4 Military Standard:<sup>6</sup>

MIL-STD-129 Marking for Shipment and Storage

2.5 AMS Specification:<sup>7</sup>

AMS 2772 Heat Treatment of Aluminum Alloy Raw Materials

<sup>&</sup>lt;sup>B</sup> Analysis shall be made for the elements for which limits are shown in this table.

<sup>&</sup>lt;sup>C</sup> For purposes of determining conformance to these limits, an observed value or a calculated value obtained from analysis shall be rounded to the nearest unit in the last right-hand place of figures used in expressing the specified limit, in accordance with the rounding-off method of Practice E29.

<sup>&</sup>lt;sup>D</sup> In case of a discrepancy in the values listed in Table 1 with those listed in the *International Alloy Designations and Chemical Composition Limits for Wrought Aluminum and Wrought Aluminum Alloys* (known as the "Teal Sheets"), the composition limits registered with the Aluminum Association and published in the "Teal Sheets" shall be considered the controlling composition. The "Teal Sheets" are available at http://www.aluminum.org/tealsheets.

<sup>&</sup>lt;sup>E</sup> Others includes listed elements for which no specific limit is shown as well as unlisted metallic elements. The producer may analyze samples for trace elements not specified in the specification. However, such analysis is not required and may not cover all metallic Others elements. Should any analysis by the producer or the purchaser establish that an Others element exceeds the limit of Each or that the aggregate of several Others elements exceeds the limit of Other Elements Total, the material shall be considered non-conforming.

Other elements—Total shall be the sum of unspecified metallic elements 0.010 % or more, rounded to the second decimal before determining the sum.

<sup>&</sup>lt;sup>G</sup> Vanadium 0.05 % max.

<sup>&</sup>lt;sup>H</sup> The aluminum content shall be calculated by subtracting from 100.00 % the sum of all metallic elements present in amounts of 0.010 % or more each, rounded to the second decimal before determining the sum.

<sup>&</sup>lt;sup>1</sup> Alloy clad with Alloy 7072.

Composition of cladding alloy as applied during the course of manufacture. The samples from finished tube shall not be required to conform to these limits.

<sup>&</sup>lt;sup>K</sup> A Zr + Ti limit of 0.25 percent maximum may be used with this alloy designation for extruded and forged products only, but only when the supplier or producer and the purchaser have mutually so agreed. Agreement may be indicated, for example, by reference to a standard, by letter, by order note, or other means which allow the Zr + Ti limit.

To determine conformance to this specification, each value for tensile strength and for yield strength shall be rounded to the nearest 0.1 ksi and each value for elongation to the nearest 0.5 % both in accordance with the rounding-off method of Practice E29.

Coiled tube is generally available with a maximum wall thickness of 0.083 in. and only in non-heat-treatable alloys.

Divided strength to be determined only on straight tube.

E Elongation of full-section and cut-out sheet-type specimens is measured in 2 in. of cut-out round specimens, in 4x specimen diameter.

In this alloy tube other than round is produced only in the F (as drawn) and O tempers. Properties for F temper are not specified, guaranteed, tested, or provided.

<sup>&</sup>lt;sup>G</sup> Beginning with the 1982 issue the requirements for the H112 tempers were replaced by the H113 temper, applicable to other than round tube, which is fabricated by cold-forming annealed round tube and acquires some temper in this forming operation.

<sup>H</sup> Material in the T42 or T62 tempers is not available from the material producers.

2.6 Federal Standard:<sup>6</sup>

Fed. Std. No. 123 Marking for Shipment (Civil Agencies)

2.7 Other Standards<sup>8</sup>

CEN EN 14242 Aluminum and Aluminum Alloys – Chemical Analysis – Inductively Coupled Optical Emission Spectral Analysis

#### 3. Terminology

- 3.1 Definitions:
- 3.1.1 Refer to Terminology B881 for definitions of product terms used in this specification.
- 3.2 Definitions of Terms Specific to This Standard:
- 3.2.1 *capable of*—the test need not be performed by the producer of the material. However, should subsequent testing by the purchaser establish that the material does not meet these requirements, the material shall be subject to rejection.
- 3.2.2 drawn seamless tube/pipe—tube/pipe which does not contain any junction lines or welds of any type resulting from method of manufacture, that is subjected to drawing after extrusion having certain standardized sizes of outside diameter and wall thicknesses commonly designated by "Nominal Pipe Sizes" and American National Standards Institutes (ANSI) Schedule Numbers. Note that while this is a combined US Customary and Metric Units specification, there are no standard equivalent metric sizes for Pipe. Metric sizes are converted and shown only for user convenience.

## 4. Ordering Information

- 4.1 Orders for material to this specification shall include the following information:
- 4.1.1 This specification designation (which includes the number, the year, and the revision letter, if applicable),
- 4.1.2 Quantity in pieces or pounds [kilograms],
- 4.1.3 Alloy (Section 7),
- 4.1.4 Temper (Section 8),
- 4.1.5 Cross-sectional dimensions (outside diameter and wall thickness, or inside diameter and wall thickness for round tube; for tube other than round, square, rectangular, hexagonal, or octagonal with sharp corners, a drawing is required),
  - 4.1.6 Length (straight or coiled),
  - 4.1.7 Nominal inside diameter of coils and weight [mass] or maximum outside diameter, if applicable,
  - 4.1.8 For alloy Alclad 3003 or Alclad 3102 state clad inside or outside (17.1).
- 4.2 Additionally, orders for material to this specification shall include the following information when required by the purchaser:
- 4.2.1 For alloys 6061, 6063, and 6262, specify if Extrusion Press Solution Heat Treatment in accordance with Practice B807/B807M is not acceptable (11.2).
  - 4.2.2 Whether heat treatment in accordance with Practice B918/B918M is required (11.3),
  - 4.2.3 Whether flattening tests are required (Section 9 and Table 5 [Table 6]),
  - 4.2.4 Whether flare testing is required (Section 10),
  - 4.2.5 Whether 7075-O material is required to develop requirements for T73 temper (12.3),
- 4.2.6 Whether testing for leaks is required and, when leaks are allowed, the number of leaks allowed and the manner of marking leaks (15.1.3.2),
  - 4.2.7 Whether inside cleanness test is required on coiled tubes (16.2) and frequency of testing required,
- 4.2.8 Whether inspection or witness of inspection and tests by the purchaser's representative is required prior to material shipment (Section 20),
  - 4.2.9 Whether certification is required (Section 22),
- 4.2.10 Whether marking for identification is required or there are exceptions to identification marking as provided in Practice B666/B666M (Section 23), and
  - 4.2.11 Whether Practices B660 applies, and if so, the levels of preservation, packaging, and packing required (Section 24).
  - 4.2.12 Whether 7075 alloy Zr+Ti limit applies (Table 1, Footnote K).

<sup>&</sup>lt;sup>1</sup> For specified wall thickness under 0.025 in., elongation is not required.

<sup>&</sup>lt;sup>1</sup> Applicable only to round tube. The maximum yield strength for other-than-round tube shall be negotiated.

K Material in this temper exhibits improved resistance to stress corrosion compared to that of the T6 temper. The stress-corrosion resistance capability of individual lots is determined by testing the previously selected tension-test samples in accordance with the applicable electrical conductivity acceptance criteria of Table 4.

<sup>&</sup>lt;sup>8</sup> Available from European Committee for Standardization, Central Secretariat (CEN), rue de Stassart 36, B1050 Brussels, Belgium. http://www.cen.eu/esearch.
