

Designation: E1234 – 12 (Reapproved 2020)

Standard Practice for Handling, Transporting, and Installing Nonvolatile Residue (NVR) Sample Plates Used in Environmentally Controlled Areas for Spacecraft¹

This standard is issued under the fixed designation E1234; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice covers the handling, transporting, and installing of sample plates used for the gravimetric determination of nonvolatile residue (NVR) within and between facilities.

1.2 The values stated in SI units are to be regarded as the standard.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.4 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

3. Terminology

3.1 *Definitions:*

3.1.1 *ISO Class N (airborne particulate cleanliness class), n*—level of airborne particulate concentrations as defined in ISO 14644-1 and 14644-2, where 10^N is the maximum allowable concentrations (particles per cubic metre).

3.1.1.1 *Discussion*—The considered particle sizes (lower threshold values) applicable for classification with ISO 14644-1 are limited to the range from 0.1 through 5 μm . Particles larger than 5 μm (macroparticles) may be expressed in accordance with Annex E of ISO 14644-1.

3.1.2 *FS209, n*—the level of cleanliness specified by the maximum allowable number of particles per cubic foot of air as defined in FED-STD-209E.

3.1.2.1 *Discussion*—This is provided for information and to facilitate the transition to the use of the ISO classification standard (ISO 14644-1).

3.1.3 *clean area, n*—a general term that includes cleanrooms, controlled areas, good housekeeping areas, and other areas that have contamination control by physical design and specified operating procedures.

¹ This practice is under the jurisdiction of ASTM Committee E21 on Space Simulation and Applications of Space Technology and is the responsibility of Subcommittee E21.05 on Contamination.

Current edition approved April 1, 2020. Published April 2020. Originally approved in 1988. Last previous edition approved in 2012 as E1234 – 12. DOI: 10.1520/E1234-12R20.

⁴ Available from Institute of Environmental Sciences and Technology, 940 E. Northwest Highway, Mount Prospect, IL 60056, and U.S. government sources.

⁵ Available from American Society of Mechanical Engineers, United Engineering Center, 345 E. 47th St., New York, NY 10017.

3.1.4 *clean zone, n*—a defined space in which the contamination is controlled to meet specified cleanliness levels.

3.1.5 *contaminant, n*—unwanted molecular and particulate matter that could affect or degrade the performance of the components upon which they reside.

3.1.6 *contamination, n*—a process of contaminating.

3.1.7 *controlled area, n*—an environmentally controlled area, operated as a cleanroom, but without the final stage of HEPA (or better) filters used in cleanrooms.

3.1.7.1 *Discussion*—Only rough filters (50 to 60 % efficiency) and medium efficiency filters (80 to 85 % efficiency) are required for a controlled area. The maximum allowable airborne particle concentrations are ISO Class 8.5 (FS209 Class 283 000) area for particles $\geq 0.5 \mu\text{m}$ and ISO Class 8 (FS209 Class 100 000) for particles $\geq 5.0 \mu\text{m}$.

3.1.8 *environmentally controlled areas, n*—cleanrooms, controlled areas, good housekeeping areas, and other enclosures that are designed to protect products from contamination.

3.1.8.1 *Discussion*—Cleanliness is achieved by controlling air purity, temperature, humidity, materials, garments, and personnel activities.

3.1.9 *facility (clean facility), n*—the total real property required to accomplish the cleanroom functions.

3.1.10 *good housekeeping area, n*—an environmentally controlled area without quantitative cleanliness requirements but maintained in a visibly clean condition.

3.1.10.1 *Discussion*—Office, laboratory, and storage areas with air conditioning and janitorial service are typical of good housekeeping areas.

3.1.11 *HEPA (high efficiency particulate air) filter, n*—a filter for air with a removal efficiency in excess of 99.97 % for 0.3- μm sized particles.

3.1.11.1 *Discussion*—For this application, HEPA filters shall meet the requirements of IEST-RP-CC001.3, IEST-RP-CC007.1, IEST-RP-CC034.1, and 6.8 of this practice.

3.1.12 *molecular contaminant—nonparticulate contaminant, n*—nonparticulate matter.

3.1.12.1 *Discussion*—The molecular contaminant may be in a gaseous, liquid, or solid state. It may be uniformly or nonuniformly distributed or be in the form of droplets. Molecular contaminants account for most of the NVR.

3.1.13 *NVR (nonvolatile residue), n*—quantity of residual soluble, suspended, and particulate matter remaining after the controlled evaporation of a volatile liquid at a specified temperature.

3.1.13.1 *Discussion*—The liquid is usually filtered through a membrane filter, of a specified size, before evaporation. The process used to determine the NVR may affect the quantitative measurement. Process factors include filter size, solvent, and the evaporation temperature and atmosphere. For this reason, the process must be defined.

3.1.14 *particle (particulate contaminant), n*—a piece of matter in a solid or liquid (droplet) state with observable length, width, and thickness. The size of a particle is usually defined by its greatest dimension and is specified in micrometers.

3.1.15 *separative device, n*—equipment utilizing constructional and dynamic means to create assured levels of separation between the inside and outside of a defined volume. Some industry-specific examples of separative devices are clean air hoods, containment enclosures, gloveboxes, isolators and mini-environments.

4. Summary of Practice

4.1 Covered, stainless steel, NVR plates are transported in a sealed carrier within an outer nylon bag to the facility that is to be monitored for NVR deposition.

4.2 The outer bag is removed from the plate carrier within the entrance air lock of the cleanroom, controlled area, or other environmentally controlled area in accordance with the operational procedures for that facility and associated clean areas.

4.3 The clean NVR plate carrier is taken into the clean area.

4.4 Locations for attaching the plates within the clean area are in accordance with the facility contamination control plan, operating procedures, and other official documentation.

4.5 Each NVR plate is removed from the carrier, the cover is removed, and the plate is mounted in a vertical position within the clean area.

4.6 The cover is returned to the plate carrier for storage until required when the plates are collected after the required exposure time.

4.7 One of the NVR plates is removed from the carrier, the cover is removed, the cover is replaced, and the plate is returned to the carrier. This NVR plate is handled in the same manner as the exposed plates. This plate is designated as the blank or control sample.

4.8 After exposure, the NVR plates are removed from their locations in the clean area and are replaced with clean NVR plates in accordance with the facility and clean area contamination control plan, operating procedures, and other official documents.

4.9 The exposed plates are covered and placed into the original NVR plate carrier, returned to the analysis laboratory, and processed in accordance with Test Method E1235.

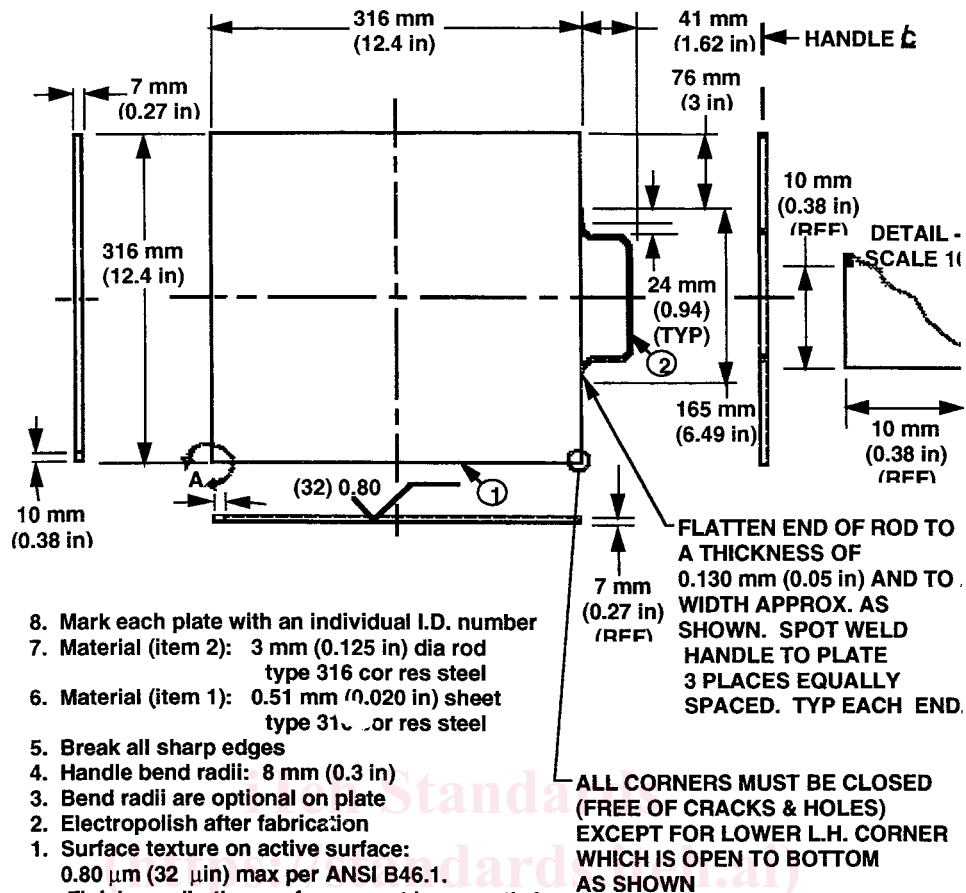

5. Apparatus and Materials

5.1 *NVR Plate*, Type 316 corrosion-resistant steel with an area of approximately 0.1 m^2 (1 ft^2). The plate shown in Fig. 1 has been found to be satisfactory. The surface texture of the sampling surface shall be $0.80 \mu\text{m}$ ($32 \mu\text{in.}$) or better per ANSI/ASME B46.1. The plate shall be electropolished and engraved with an identification number.

5.2 *NVR Plate Cover*, Type 316 corrosion-resistant steel. The cover shown in Fig. 2 has been found to be satisfactory. The surface texture shall be $0.80 \mu\text{m}$ ($32 \mu\text{in.}$) or better per ANSI/ASME B46.1.

5.3 *Noncontaminating Nylon (Polyamide) Bag* to enclose each covered NVR plate.⁶

⁶ Heat-sealable Capran 980 from Allied Chemical has been found to be satisfactory.

8. Mark each plate with an individual I.D. number
7. Material (item 2): 3 mm (0.125 in) dia rod type 316 cor res steel
6. Material (item 1): 0.51 mm (0.020 in) sheet type 316 cor res steel
5. Break all sharp edges
4. Handle bend radii: 8 mm (0.3 in)
3. Bend radii are optional on plate
2. Electropolish after fabrication
1. Surface texture on active surface: 0.80 μm (32 μin) max per ANSI B46.1. Finish on all other surfaces must be smooth & free of all tool marks

FLATTEN END OF ROD TO A THICKNESS OF 0.130 mm (0.05 in) AND TO WIDTH APPROX. AS SHOWN. SPOT WELD HANDLE TO PLATE 3 PLACES EQUALLY SPACED. TYP EACH END.

ALL CORNERS MUST BE CLOSED (FREE OF CRACKS & HOLES) EXCEPT FOR LOWER L.H. CORNER WHICH IS OPEN TO BOTTOM AS SHOWN

FIG. 1 NVR Collector Plate

FIG. 2 NVR Plate Cover

5.3.1 Bags shall meet the safety and outgassing requirements for the spacecraft and spacecraft processing facility and shall not contain or generate molecular or particulate matter that could contaminate the NVR plate or NVR plate carrier.

5.4 *NVR Plate Carrier*—The sealable, aluminum carrier shown in Fig. 3 has been found to be satisfactory. The carrier shall be constructed so as to prevent cross contamination between plates.

5.5 *Noncontaminating Nylon (Polyamide) Bag*⁵, to protect the NVR plate carrier in 5.4. The polyamide film material shall meet the safety and outgassing requirements for the spacecraft and spacecraft processing facility. (See Note 2.)

5.6 *HEPA filtered*, ISO Class 5 (FS209 Class 100), or better environment, as defined in ISO 14644-1, unidirectional air flow, clean work station.

5.7 *Gloves*, solvent compatible and resistant.⁷ (**Warning**—Gloves shall be used to protect the hands from accidental spills of the NVR solvent and minimize contamination of exposed samples. Gloves shall be selected to meet local safety and contamination control requirements.)

5.8 *Oil-Free Aluminum Foil*,⁸ to cover the NVR plate if the cover in 6.2 is not used.

5.9 *HEPA Filters*—All HEPA filters shall be constructed of low outgassing, corrosion-resistant, and fire-resistant materials such as Grade 1 in IES-RP-CC001.3. Filters with stainless steel or aluminum frames should be considered. The filters shall not be tested with DOP (dioctylphthalate) or other liquid aerosols. Ambient air and solid aerosol test methods are acceptable

⁷ Pioneer green nitrile gloves, Catalog No. A10-1, have been found to be satisfactory.

⁸ Fed Spec. Food Service Grade aluminum foil, oil free, Federal Stock No. 8135-00-724-0551 has been found to be satisfactory.
