

Designation: D2598 – 21

# Standard Practice for Calculation of Certain Physical Properties of Liquefied Petroleum (LP) Gases from Compositional Analysis<sup>1</sup>

This standard is issued under the fixed designation D2598; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

## 1. Scope\*

1.1 This practice covers, by compositional analysis, the approximate determination of the following physical characteristics of commercial propane, special-duty propane, commercial propane/butane mixtures, and commercial butane (covered by Specification **D1835**): vapor pressure, relative density, and motor octane number (MON).

1.1.1 This practice is not applicable to any product exceeding specifications for nonvolatile residues. (See Test Method **D2158**.)

1.1.2 For calculating motor octane number, this practice is applicable only to mixtures containing 20 % or less of propene.

1.1.3 For calculated motor octane number, this practice is based on mixtures containing only components shown in **Table 1**.

1.2 The values stated in SI units are to be regarded as standard.

### 1.2.1 Exceptions:

1.2.1.1 Non-SI units in parentheses are given for information only.

1.2.1.2 Motor octane number and relative density are given in MON numbers and dimensionless units, respectively.

1.3 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

## 3. Summary of Practice

3.1 The composition of a sample of LP-gas is obtained by using Test Method **D2163** or other acceptable method. From the analysis (expressed in liquid volume percent), the vapor pressure, relative density, and motor octane number of the sample may be determined.

3.2 Conversion of a compositional analysis from mole, gas volume, or weight basis to liquid volume is obtained by using Practice **D2421** or other suitable method.

## 4. Significance and Use

4.1 Vapor pressure is an important specification property of commercial propane, special duty propane, propane/butane mixtures, and commercial butane that assures adequate vaporization, safety, and compatibility with commercial appliances. Relative density, while not a specification criterion, is necessary for determination of filling densities and custody

**TABLE 1 Factors for Determining the Physical Characteristics of LP-Gases<sup>A</sup>**

Component	Vapor Pressure Blend Factor, kPa-gauge (PSIG) at 37.8 °C (100 °F)	Relative Density at 15.6 °C/15.6 °C (60 °F/60 °F)	MON Blend Value
Methane	17547 (2545)	0.3	...
Ethane	4213 (611)	0.35628	100.7
Ethene (Ethylene)	8720 (1265)	0.37	75.6
Propane	1200 (174)	0.50719	97.1
Propene (Propylene)	1466 (213)	0.52260	84.9
Methylpropane (Isobutane)	400 (58)	0.56283	97.6
<i>n</i> -Butane	255 (37)	0.58420	89.6
<i>t</i> -2-Butene	242 (35)	0.61030	...
1-Butene	328 (48)	0.60044	80.8
2-Methylpropene (Isobutylene)	340 (49)	0.60064	...
<i>c</i> -2-Butene	216 (31)	0.62716	83.5
2,2-Dimethylpropane (Neopentane)	152 (22)	0.59530	80.2
Cyclopentane	-33 (-4.7)	0.75047	84.9
2-Methylbutane (Isopentane)	40 (5.8)	0.6251	90.3
<i>n</i> -Pentane	6.4 (0.9)	0.6307	62.6
<i>n</i> -Hexane	-67 (-9.7)	0.6641	26.0

<sup>A</sup> Some constants for vapor pressure and motor octanes are empirical values to be used only in the calculation procedures described in this practice. References are located in [Appendix X1](#).

transfer. The motor octane number (MON) is useful in determining the products' suitability as a fuel for internal combustion engines.

## 5. Calculation

5.1 *Calculated LP-Gas Vapor Pressure* (see Test Method [D1267](#)):

5.1.1 Calculate the partial gauge vapor pressure due to each component in the mixture as follows:

$$\text{Partial gauge vapor pressure} = (vp' \times C)/100 \quad (1)$$

where:

$vp'$  = vapor pressure factor of specific component at 37.8 °C (100 °F) (see [Table 1](#)), and

$C$  = liquid volume percent of component in the mixture.

5.1.2 Add the partial gauge vapor pressures due to all components, rounding to the nearest 7 kPa (1 psi). The total is reported as the LP-gas vapor pressure of the sample, kPa gauge at 37.8 °C (100 °F).

5.2 *Calculated Relative Density* (see Test Method [D1657](#)):

5.2.1 Calculate the relative mass of each component in the mixture as follows:

$$\text{Relative mass of component} = (sg' \times C)/100 \quad (2)$$

where:

$sg'$  = relative density of the pure component at 15.6 °C (60 °F) (see [Table 1](#)), and

$C$  = liquid volume percent of component in the mixture.

5.2.2 Add the relative mass of all components, rounding the total to three decimal places. The total is reported as the relative density of the mixture.

5.3 *Calculated Motor Octane Number* (see ASTM Data Series DS 4B.<sup>5</sup>).

5.3.1 Using only the components and values in [Table 1](#), calculate the partial motor octane number of each component in the mixture to the nearest 0.1 MON as follows:

$$\text{Partial motor octane number of component} = (m \times C)/100 \quad (3)$$

where:

$m$  = motor octane number of component (see [Table 1](#)), and

$C$  = liquid volume percent of component in mixture.

5.3.2 Add the partial motor octane numbers of all components determined in [5.3.1](#) and round the total to the nearest one-half number. The total is reported as the calculated motor octane number of the mixture.

## 6. Keywords

6.1 butane; calculated physical properties; liquefied petroleum gases; motor octane number; propane; relative density; vapor pressure
