

Designation: ~~F3101--21~~ F3101 – 21a

Standard Specification for Unsupervised Public Use Outdoor Fitness Equipment¹

This standard is issued under the fixed designation F3101; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

INTRODUCTION

The goal of this specification is to promote proper design, manufacturing, installation, and operational practices for unsupervised outdoor fitness equipment for use in parks, schools, institutions, multiple-family dwellings, private resorts, recreation developments and other areas. These products are intended to be used by individuals age 13 and older and typically are used in an unsupervised setting. Through these specifications, this specification aims to assist designers, manufactures, and owner/operators in reducing the possibility of injury.

Adult anthropometrics are used in the design of this equipment. The equipment specifications set forth in this standard are for equipment intended for use by individuals 13 and older. Adults must take precautions and prevent children under their supervision from accessing and using this equipment. This standard specifies requirements that are generally applicable to all outdoor fitness equipment used in an unsupervised setting.

The equipment user must recognize, however, that a standard alone will not necessarily prevent injuries. Like other physical activities, exercise involving outdoor fitness equipment, involves the risk of injury, particularly if the equipment is used improperly, not properly installed or not properly maintained. In addition, users with physical limitations should be aware of their capabilities and limitations in the use of this type of equipment and seek appropriate advice prior to using it. Certain physical conditions or limitations may preclude some persons from using this equipment properly and without increasing the risk of serious injury. While the designer, manufacturer, and owner cannot control the public use of this unsupervised equipment they can address known causes of injuries to the most vulnerable users and unintended users-at-risk defined as those under the age of 13. Good design and best practice would dictate that these facilities are not in physical proximity or physically separated from playground for children because of hazardous conditions children cannot appreciate.

1. Scope

1.1 This specification establishes parameters for the design and manufacture of outdoor fitness equipment as defined in **3.1.30**.

1.2 It is intended that these fitness products will be used in an unsupervised outdoor setting or environment and will be permanently anchored.

1.2.1 It is the intent of this specification to only specify requirements for outdoor fitness equipment and its installation and not the design of the facility or grounds on which the products are to be installed.

¹ This specification is under the jurisdiction of ASTM Committee F08 on Sports Equipment, Playing Surfaces, and Facilities and is the direct responsibility of Subcommittee F08.30 on Fitness Products.

Current edition approved ~~March 1, 2021~~ July 1, 2021. Published July 2021. Originally approved in 2015. Last previous edition approved in ~~2015~~ 2021 as F3101 – 15: F3101 – 21. DOI: ~~10.1520/F3101-21~~ 10.1520/F3101-21A.

1.3 The specifications set forth in this standard are intended to minimize the likelihood of serious injuries.

1.3.1 The specifications set forth in this standard are for outdoor fitness equipment intended for use in an unsupervised setting by individuals age 13 and older.

1.4 The values stated in SI (metric) units are to be regarded as standard. The values in parentheses are for information only.

1.5 *General Measures, Tolerances, and Conversions:*

1.5.1 The general tolerances for this specification (unless otherwise specified) are as follows:

Dimension	Tolerance
X mm (X in.)	± 13.0 mm (0.5 in.)
X.X mm (X.X in.)	± 1.3 mm (0.05 in.)
X.XX mm (X.XX in.)	± 0.130 mm (0.005 in.)

1.5.2 These tolerances still apply to a dimension even when terms like greater than, less than, minimum, or maximum are used.

1.6 This standard is to be used in conjunction with Test Methods **F2571** and Specification **F2276**. If a design or installation concern is not addressed in this specification then the applicable requirements of Specification **F2276** shall be used.

1.6.1 This standard takes precedence over Specification **F2276** and Test Methods **F2571** in areas that are addressed in this document.

1.7 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.8 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

3. Terminology

3.1 *Definitions of Terms Specific to This Standard:*

3.1.1 *accessible area, n*—area accessible to the user or third party when the equipment is used as intended, grasped, or adjusted.

3.1.1.1 *Discussion*—

This area encompasses a region from the floor to a height of 2134 mm (84 in.) above the underlying surface. This does not include areas that are accessible during the initial assembly.

3.1.2 *accessible, adj*—relating to a part or portion of the outdoor fitness equipment that (1) can be contacted by any body part or (2) is approachable or usable, or both, by persons of varying abilities.

3.1.3 *accessible route, n*—pathway specifically intended to provide access for individuals with disabilities.

3.1.4 *applied handgrips, n*—handgrips that are formed, molded, or attached to a support, component, or structure.

3.1.5 *clearance space, n*—area beneath and immediately adjacent to outdoor fitness equipment that is designated for unrestricted circulation around the equipment and on whose surface it is predicted that a user would land when falling from or exiting the equipment.

3.1.6 *completely bounded opening, n*—any opening in a piece of equipment that is totally enclosed by boundaries on all sides such that the perimeter of the opening is continuous.

3.1.7 *component, n*—any portion of a structure that generates specific activity and cannot stand alone.

3.1.8 *composite fitness structure, n*—two or more fitness structures attached or functionally linked, to create one integral unit that provides more than one fitness activity; an example is a combination horizontal ladder, chinning bar, vertical lunge, and balance beam.

3.1.9 *corner, n*—intersection of three planes or surfaces on a single component.

3.1.10 *crush point, n*—location between two moving components that when entered can cause a portion of the body to suffer a contusion, laceration, abrasion, amputation, or fracture.

3.1.11 *cycle, n*—movement of a point or load away from a starting position and back to the same starting position. The cycle being executed through the full range of intended motion.

3.1.12 *designated use surface, n*—any elevated surface intended for gripping/hanging, standing, walking, sitting, or climbing.

3.1.13 *edge, n*—intersection of two planes or surfaces on a single component.

3.1.14 *engagement means, n*—the portion of the outdoor fitness equipment that is moved by the user to perform the intended exercise as defined by the manufacturer.

3.1.15 *entanglement, n*—condition in which an article on the user such as clothing, hair or something around the user's neck becomes caught or entwined on a component of outdoor fitness equipment.

⁵ Available free at: <http://www.ada.gov/regs2010/ADAREgs2010.htm>.

- 3.1.16 *entrapment*, *n*—condition which impedes withdrawal of a body or body part that has penetrated an opening.
- 3.1.17 *extrinsic loads*, *n*—all loads applied to the machine or engagement means in addition to the users body weight.
- 3.1.18 *fall height*, *n*—vertical distance between a designated use surface and the protective surfacing beneath it.
- 3.1.19 *foot support*, *n*—portion of the outdoor fitness equipment intended to support all or a portion of the user’s body weight or exertion during the performance of the intended exercise as defined by the manufacturer. May be a “step”, “stair” or “rung” as defined in this section.
- 3.1.20 *functional training grip*, *n*—typically a free form shape designed to be gripped for climbing and hanging exercises. Also referred to as rock climbing grips typically found on climbing walls or structures.
- 3.1.21 *general warning label*, *n*—label designed within the scope of this specification and Specification **F1749** which is affixed to a portion of the fitness equipment and draws attention to potential hazards associated with the use of that equipment.
- 3.1.22 *grasp*, *v*—to hold by hand, may be done to support one’s self for balance or guidance; hands fit around only a portion of the circumference of the object.
- 3.1.23 *grip*, *v*—to hold by hand tightly so one does not slip or fall or so that one can execute force to initiate or control movement of the apparatus; hands fit around a majority of the circumference of the object.
- 3.1.24 *guard*, *n*—cover or enclosure that limits access to an otherwise accessible area.
- 3.1.25 *integral handgrips*, *n*—handgrips that are created by, coating, texturing or otherwise modifying the material of a component or support structure.
- 3.1.26 *intended use*, *n*—the use of the outdoor fitness equipment as described in the manual or on the signage provided with it and/or as is readily apparent from its use as fitness equipment. <https://standards.iteh.ai/catalog/standards/sist/dc2c2abc-9785-4ce2-b68d-af232e5bb8eb/astm-f3101-21a>
- 3.1.27 *intrinsic loads*, *n*—the loads applied to fitness equipment due only to the user’s body weight.
- 3.1.28 *maximum specified load*, *n*—maximum working load for the machine as set by the manufacturer.
- 3.1.29 *maximum tension developed*, *n*—maximum static tensile load experienced by a connector, fitting, rope, belt, chain, or other component during use of the machine at the maximum specified load for the machine including all extrinsic loads.
- 3.1.30 *outdoor fitness equipment*, *n*—an anchored structure or mechanical apparatus intended for unsupervised outdoor public use on which the user trains or exercises specific or multiple muscles of the body.
- 3.1.30.1 *Discussion*—
Not to include toys used for recreation, jump ropes, outdoor playground equipment or facilities, military facilities or equipment designed for military training, bicycles or other fitness soft goods such as gloves, belts, apparel, balls, and so forth. Independent loose items intended to be manipulated by the intended users are not covered in this standard.
- 3.1.31 *owner’s manual*, *n*—documentation supplied and intended by the manufacturer to convey information, including safety features and warnings, to the owner about the equipment, its installation, inspection, maintenance, and repair.
- 3.1.32 *partially bounded opening*, *n*—any opening in a piece of equipment that is not totally enclosed by boundaries on all sides so that the perimeter of the opening is discontinuous.
- 3.1.33 *platform*, *n*—flat surface, intended for the user(s) to stand, and upon which the user(s) can move freely.

- 3.1.34 *professional judgment, n*—ability of an individual with current knowledge, skill or experience, or both, in the field of outdoor fitness equipment design, use, or operations, which enables that person to form an opinion or make a decision, or both, concerning a matter within that field of expertise.
- 3.1.35 *projection, n*—condition which, due to its physical nature, must be tested to the requirements of this standard to determine whether it is a protrusion and/or entanglement hazard.
- 3.1.36 *protective surfacing, n*—material(s), if required, to be used within the clearance space of the outdoor fitness equipment in accordance with Specifications **F1292** and **F1951** where applicable.
- 3.1.37 *protrusion, n*—projection which, when tested in accordance with the requirements of this standard is found to be a hazard having the potential to cause bodily injury to a user who impacts it.
- 3.1.38 *range of movement, operator, n*—space in which the user or part of the user is moving when using the machine as recommended by the manufacturer.
- 3.1.39 *range of movement, equipment, n*—space in which the equipment component(s) can move or be moved during the operation of the equipment.
- 3.1.40 *resistance means, n*—the device or system that provides a resistive force to the user during exercise. This system may or may not be adjustable where the user can vary the device or system to increase or decrease the force encountered.
- 3.1.41 *rung, n*—cross piece in a ladder or other climbing equipment used for supporting the user’s feet or for grasping by the user’s hands and/or both.
- 3.1.42 *serious injury, n*—an acute physical injury requiring medical treatment in a hospital or clinic under the supervision of a qualified doctor or nurse; examples of such injuries includes burns, fractures, lacerations, internal injury, injury to organs, concussion, internal bleeding, etc.
- 3.1.43 *sharp edge, n*—edge that can cut a user’s skin.
- 3.1.44 *sharp point/corner, n*—point or corner that can puncture or lacerate a user’s skin.
- 3.1.45 *shear point, n*—location at which parts move past one another or past a fixed point in such a manner that, when entered, can cause a portion of the body to become seriously injured in a scissors action between the components.
- 3.1.46 *site specific label, n*—label designed within the scope of this specification and Specification **F1749** which is affixed to a portion of the equipment and draws attention to a potential hazard in the immediate area of the label.
- 3.1.47 *step, n*—horizontal flat surface of a ladder or stair used primarily as a foot support.
- 3.1.48 *third party, n*—someone other than the user who is in the immediate area of the fitness equipment when it is in use.
- 3.1.49 *training envelope, n*—maximum space in which the user and machine components traverse when the machine is operated in accordance with the instructions. (see also operator range of movement and equipment range of movement). Synonymous with “use zone”.
- 3.1.50 *trip hazard, n*—abrupt change in elevation that may not be clear and obvious to the user.
- 3.1.51 *upper body fitness equipment, n*—fitness equipment intended to exercise the upper body (torso and arms). For the purposes of this standard this may also encompass overhead components intended to support a user by the hands only (for example, horizontal ladders, chinning bars, and ring ladders).

3.1.52 *user weight (maximum), n*—manufacturer defined weight of the exerciser that the equipment was designed to accommodate.

3.1.53 *user support, n*—a surface or structure that supports a portion or all of the user’s body weight while performing the intended exercise as defined by the manufacturer.

4. Requirements for Access/Egress

4.1 Accessibility of outdoor fitness equipment installed in the United States and its territories shall meet the following accessibility requirements.

4.2 Accessible Routes to and around outdoor fitness equipment shall meet the parameters established in the DOJ 2010 Standard for Accessible Design.

4.2.1 Accessible routes within the clearance space shall conform to the performance requirements of Specifications F1292 and F1951.

4.3 Access to outdoor fitness equipment machines or structures shall meet the parameters established in the DOJ 2010 Standard for Accessible Design.

4.4 Spacing between individual pieces of outdoor fitness equipment or structures shall meet the parameters established in the DOJ 2010 Standard for Accessible Design and Section 9 of this specification.

5. Equipment Types

5.1 *General Descriptions*—Outdoor fitness equipment varies and all designs may not be represented specifically in each of the following sections. The following sections are intended to group the most prevalent equipment as well as accommodate future designs.

5.2 *Fixed Apparatus*—Equipment with non-moving parts, such as bars, beams, overhead equipment, benches, racks, step platforms and climbing structures.

5.2.1 *Push-up Bars*—These pieces are installed at low heights and used to push off of, pull up, or other stretching exercises with the intent that the user maintains contact with the ground during use.

5.2.2 *Upper Body Equipment*—This type of equipment may have various forms that have relatively high or overhead installed heights and are used to hang from, or perform other upper body exercises.

5.2.3 *Racks/Benches*—This equipment is intended for sitting on, lying on, or performing exercises at mid-level heights greater than 406 mm (16.0 in.) and less than 1219 mm (48.0 in.) from the installation surface. They include sit-up benches, parallel bars, and similar products.

5.2.4 *Climbing Equipment*—This type of equipment requires a minimum 3 point of contact use to scale the activity. Examples include climbing nets or bouldering walls.

FIG. 1 Fixed Apparatus

FIG. 2 Resistance Apparatus

FIG. 3 Swinging Apparatus

5.2.5 *Jumping Equipment*—These pieces have various forms but all require the user to jump as part of the exercise. Examples include step platforms and jump touch beams.

5.2.6 *Balance Beams*—These pieces are narrow surfaces intended for balancing activities.

5.3 *Resistance Apparatus*—Equipment designed/intended for strength/resistance training that lifts the user or provides resistive loads that must be overcome to move the engagement means.

5.3.1 For equipment that lifts the user, handles or other end effectors are connected by joints and linkages to a seat or platform on which a user rests; when operated, the user is lifted to generate resistance against movement of the end effector. Examples include chest presses, lat pulls, leg presses.

5.4 *Swinging Apparatus*—Equipment with moving parts intended for motion simulation exercise that may or may not lift the user but potentially utilizes rapid cyclical movement of equipment joints and linkages. Examples include ellipticals, airwalkers, stepper machines.

6. Materials and Construction

6.1 *General Requirements*—Outdoor fitness equipment shall be manufactured and constructed only of materials that have a demonstrated durability in an outdoor setting. Any new materials being considered by manufacturers shall be tested accordingly for durability by the outdoor fitness equipment manufacturer. When choosing materials, the manufacturer should take into account entrapment and entanglement hazards that can occur through distortion and degradation of materials during use or from environmental factors and or vandalism.

6.1.1 Metals shall be protected from rust or corrosion by painting, powder coating, galvanizing, or through other treatments. Plastics and other materials that experience ultraviolet (UV) degradation shall be protected against ultraviolet light through coating or other protective means.

6.1.2 Regardless of the material or the treatment process, the manufacturer shall ensure that all materials comply with the Consumer Product Safety Improvement Act of 2008 (CPSIA) (this includes but is not limited to coating and substrate) or other applicable standards in effect in the country of installation.

6.1.3 Wood intended for outdoor fitness equipment that is not naturally rot and insect-resistant shall be treated to resist rot and insect attack. Any wood not naturally rot and insect-resistant, which has any fabrication up to 150 mm (5.9 in.) above or below the level of the protective surface of the installation, shall be treated after the wood fabrication. Deviations shall have independent documentation of durability. Chromated copper arsenate (CCA), creosote, pentachlorophenol, tributyl tin oxide, and surface coatings that contain pesticides shall not be used for outdoor fitness equipment. Wood treaters and outdoor fitness equipment manufacturers shall practice technologies and procedures that minimize the level of dislodgeable toxin.

6.1.3.1 Wood components shall be designed in such a manner that precipitation can drain off freely and not accumulate or pool on the wood surface.

6.1.3.2 Wood surfaces shall be of materials constructed, finished and maintained to minimize the tendency for splintering.

6.1.3.3 Metal fastening systems used in wood structures or apparatus shall consider the wood treatment process of the wood material and be of suitable material to resist corrosion when exposed to the wood material and the environment.

6.1.3.4 Plywood shall be exterior or marine grade and be protected from exposure to moisture.

6.2 Fasteners:

6.2.1 All fasteners, connecting, and covering devices shall be inherently corrosion resistant or be provided with a corrosion-resistant coating.

6.2.2 When installed in accordance with the manufacturer's instructions, fasteners, connecting, and covering devices shall not loosen or be removable without the use of tools. Lock washers, self-locking nuts, or other locking means shall be provided for all nuts and bolts to protect them from detachment. Hardware in moving joints shall also be secured against unintentional loosening.

6.2.3 Hooks and connecting devices shall be subject to the requirements of Sections 7 and 8.

6.3 Moving suspended components shall be connected to the fixed support with bearings or bearing surfaces that serve to reduce friction or wear.

6.4 Steel cable that is permanently affixed to a hanger assembly performs as a bearing surface. Cable ends should be inaccessible or capped to prevent injury from frayed wires. Cables and steel-cored ropes should be protected to prevent fraying, loosening, unraveling, or excessive shifting of joints.

6.5 Plastic, rubber and other synthetic materials shall be specified with consideration given to environmental degradation. These components shall be designed and installed where inspection can be performed easily.

7. Design and Performance Requirements

7.1 *General Requirements*—Unless otherwise stated, outdoor fitness equipment shall meet the requirements set forth in this specification.

7.2 Outdoor fitness equipment represented as complying with this specification shall meet all applicable requirements specified herein. Anyone representing compliance with this specification shall keep such essential records as are necessary to document any claim that the requirements within this specification have been met.

7.3 Outdoor fitness equipment shall be anchored to the ground and not intended to be moved from its installation point during use or by the user.

7.4 Support:

7.4.1 Outdoor fitness equipment shall support the user and any additional loads applied by the user in normal operation without breakage.

7.4.2 Loading requirements for outdoor fitness equipment are set forth in Section 8 of this specification.

7.5 Edges, Corners, and Tube Ends:

7.5.1 *General*—There shall be no accessible sharp points or sharp edges on outdoor fitness equipment.

7.5.2 *Edges*—All edges in accessible areas shall be free of burrs and sharp edges.

7.5.3 *Corners*—All corners in accessible areas shall be radiused or chamfered.

7.5.4 *Tube Ends*—The exposed open ends of all tubing shall be provided with caps or plugs that cannot be removed without the use of tools.

7.6 *Protrusions*—Protrusion hazards shall not be present on outdoor fitness equipment.

7.6.1 Three projection test gauges (shown in Fig. A1.10) and a projection gauge (shown in Fig. A1.11) are required to determine whether projections are protrusions. Their use is described in this section.

7.6.2 *Accessible Projections*—A projection is not accessible and is not a protrusion when it is recessed or located in such a manner that will not allow any of the projection test gauges to be placed over it. Any of the conditions described in the remainder of this section constitute a protrusion hazard.

7.6.3 *Determining Whether a Projection is a Protrusion*—Successively place each of three gauges (see Fig. A1.10) over each accessible projection in all orientations (see Fig. A1.12 and Fig. A1.13). Determine whether the projection extends beyond the face of any gauge. The projection fails the test and is a protrusion if it extends beyond the face of any of the three gauges.

7.7 *Entanglement*—Entanglement hazards 610 mm (24 in.) or higher from the ground surface shall not be present on outdoor fitness equipment.

7.7.1 Three test gauges, a feeler gauge, and the means to accurately measure a 3.0 mm (0.12 in.) extension are required to determine whether entanglement hazards exist. Any of the conditions described in this section constitutes an entanglement hazard.

7.7.1.1 A projection that meets both of the following requirements is an entanglement hazard:

- (1) One of the three projection gauges (see Fig. A1.10) passes over the projection and contacts the initial surface.
- (2) The projection extends perpendicular ($\pm 5^\circ$) from the initial surface more than 3.0 mm (0.12 in.). The thickness of the projection gauge (see Fig. A1.11) may be used to measure the 3.0 mm (0.12 in.) extension.

7.7.2 *Projections from a Horizontal Plane*—A projection that meets the conditions of 7.7.1.1(1) and (2) and which also projects upwards from a horizontal plane (see Figs. A1.14-A1.16) is an entanglement hazard.

7.7.3 *Exposed Bolt End Projections*—Any accessible bolt end projecting beyond the face of the nut more than two full threads is an entanglement hazard (see Fig. A1.16(6)). A bolt end is inaccessible and not an entanglement hazard when the bolt end is recessed and the 89 mm (3.5 in.) OD projection gauge (see Fig. A1.10) cannot be made to contact the bolt end when the outside curve of the gauge is placed flat against the recessed area (see Fig. A1.15).

7.7.4 *Projections Which Increase in Size*—Any projection which fits within any of the three projection test gauges (see Fig. A1.10) and where the increase in size extends greater than 3.0 mm (0.12 in.) from the initial surface with a depth greater than 3.0 mm (0.12 in.) is an entanglement hazard (see Fig. A1.16).

7.7.5 *Connecting Devices*—Connecting devices such as, but not limited to, quick links, when properly closed, are not entanglement hazards. These connectors are considered closed when there is no gap or space greater than 1.0 mm (0.04 in.) when measured with a feeler gauge.

7.8 Guarding and Entrapment in Accessible Areas:

7.8.1 *General*—Shear, pull-in and crush points shall be avoided or guarded. There shall be no crush or shear points caused by junctures of two components moving relative to one another, or at an opening present at the junction of a stationary support and a rigid supporting member for a swinging component while the swinging components travel through their complete range of travel. A crush or shear point is any point that entraps at one or more positions a 25.00 mm (0.98 in.) diameter rod.

7.8.2 To reduce the likelihood of unintentional contact with a crush or shear point, an opening shall comply with either 7.8.2.1 or 7.8.2.2.

7.8.2.1 An opening with a minor dimension of less than 25 mm (1.0 in.) is acceptable if a finger probe (as illustrated in Fig. A1.17), when inserted into an opening, cannot be made to touch any crush or shear point. The probe shall be applied in all possible positions (Fig. A1.18) with an application force not to exceed 4 N (1 lb).

7.8.2.2 An opening in an enclosure with a minor dimension of 25 mm (1.0 in.) or more, shall require that the crush or shear point be located at a distance as specified in Table 1 from the plane of the opening. An enclosure in this case covers a crush or shear point.

7.8.3 *Component(s) Moving Past Fixed Component(s)*—If during the intended operation or adjustment, a component moves past a fixed component in such a manner that no shear or crush points are created, then the spacing between the fixed component and the moving component shall be less than 8 mm (0.32 in.) or greater than 25 mm (0.98 in.). If during the intended operation or

TABLE 1 Minimum Acceptable Distance from an Opening to a Crush or Shear Point

Minimum Dimension of Opening, ^A mm (in.), $\pm 0.05^B$	Minimum Distance from Opening to Part, mm (in.)
25 (1)	165 (6.5)
32 (1.25)	190 (7.5)
38 (1.5)	318 (12.5)
48 (1.875)	394 (15.5)
54 (2.125)	445 (17.5)
More than 54 (2.125) and less than 152 (6)	762 (30)

^A See 7.8.2.2.

^B Between 25 and 64 mm (1 and 2.5 in.) interpolation is used to determine values specified in the table.

adjustment, a component moves past a fixed component in such a manner that a scissors action is created, then the spacing between the fixed component and the moving component shall be 60.0 mm (2.4 in.) or greater.

7.8.4 *Component(s) Moving in Proximity to the Ground*—If during the intended operation or adjustment, a component moves past or towards the ground then the spacing between the component and the ground shall be greater than 60.0 mm (2.4 in.). If the vertically moving components are outside the user’s field of view then the distance between the parts and the ground shall be a minimum of 110 mm (4.3 in.).

7.8.5 *Component Stops*—Stops for moving components shall be guarded or inaccessible. This guarding shall not create shear points, crush points.

7.8.6 *Head and Neck Entrapment*—Outdoor fitness equipment shall be designed, constructed and assembled so that any accessible opening shall meet the performance and testing requirements set forth below. Completely and partially bounded openings below 610 mm (24 in.) are exempt from this requirement.

7.8.6.1 Outdoor fitness equipment shall meet the following performance requirements to reduce the risk of accidental head or neck entrapment by either a head-first or feet-first entry into the opening. Openings between the protective surfacing and the bottom edge of the equipment (that is, rails, platforms, steps, and so forth) are exempt from this requirement as indicated by Fig. A1.1.

(1) *Accessible Openings*—A completely bounded rigid opening is accessible when a torso test probe (see Fig. A1.2) can be inserted into the opening to a depth of 102 mm (4.0 in.) or more.

(2) *Test Procedure for Completely Bounded Rigid Openings*—Place the torso probe (see Fig. A1.2) in the opening with the plane of the base of the probe parallel to the plane of the opening; rotate the probe to its most adverse orientation (that is, major axis of the base of the probe parallel to the major axis of opening). If the torso probe can be inserted into the opening to a depth of 102 mm (4.0 in.) or more, place the head probe (see Fig. A1.3) in the opening with the plane of the base of the probe parallel to the plane of the opening. An opening passes this test if (1) the opening does not admit the torso probe when it is rotated to any orientation about its own axis, or (2) the opening admits the torso probe and also admits the head probe. An opening fails the test if the opening admits the torso probe but does not admit the head probe.

7.8.6.2 *Boundaries of Large Openings*—If the opening admits the 229-mm (9.0-in.) head probe, each portion of its boundary shall be evaluated for partially bounded opening requirements of 7.8.6.3.

7.8.6.3 *Partially Bounded Openings*:

(1) A partially bounded opening is considered accessible when any of the following conditions exist, and must meet the performance requirements as recommended in 7.8.6.3(2) and 7.8.6.3(3).

(2) If the unbounded part of a partially bounded opening is between 47.6 mm (1.875 ± 0.005 in.) and 229 mm (9.0 in.) in width when measured perpendicular to each surface, the opening can be considered accessible and must meet the conditions of 7.8.6.3(3).

(3) *Test Method*—The “A” portion of the test template (Fig. A1.4) is to be inserted along the centerline of the opening (determine the most adverse condition) (see Fig. A1.5) so that the centerline of the template follows the centerline of the opening and the plane of the template is parallel to the plane of the opening until the motion is arrested by contact between the test template and the boundaries of the opening. By visual inspection, determine if there is simultaneous contact between the sides of the template. If simultaneous contact is made the opening is accessible and must be tested using the “B” portion of the test template (see Fig. A1.6).

FIG. 4 Ground Clearance 60 mm (2.4 in.)

FIG. 5 Pendular Motion Machine

(4) If the angle test template “A” indicates failure, check for an exempted thick surface condition by positioning the plane of the “B” portion of the test template between and perpendicular to the plane of the boundaries of the opening (see Fig. A1.7 and Fig. A1.9). If the test template fits completely within the boundaries of the opening, the opening is considered hazardous and fails the test unless it allows full passage of the 229 mm (9.0 in.) head probe (see Fig. A1.8). If the template does not fit down within the boundaries of the opening (defined as the opening outlined by the contact points of the test template “A”) the opening is not considered accessible.

(5) The test template is divided into two sections. Section “A” is used first to determine accessibility. Section “B” is used to determine if the thickness of the material or the location of the opening prevents access to the opening. The thickness of 19.1 mm (0.75 in.) for the template itself is based on half of the neck depth of a 5th percentile two year old minus compression.

7.9 *Pendular, Pivoting or Swinging Motion*—Outdoor fitness equipment that functions with a swinging or pendular motion shall be fitted with dampened end-stops or other appropriate movement limitation systems. End-stops shall be kept inaccessible. The portion of the equipment going through pendular motion shall not exceed a range of motion of over 70°. See Fig. 5. -21a

7.9.1 Materials subject to loss of impact attenuation shall be addressed by the manufacturer per maintenance requirements specified in Section 12.

7.9.2 *Suspended Components*—Suspended components, such as rings on upper body equipment, shall be smoothly finished and have a minimum radius of 6.35 mm (0.25 in.) on all corners and edges.

7.9.3 *Bearing Surfaces*—All pivot points shall be designed with load and environment appropriate bearing materials.

7.10 *Adjustment and Locking Means*—All adjustment and locking means shall function securely at all adjustment positions. The possibility of inadvertent disengagement shall be reduced by spring retention, clamps, or other means.

7.10.1 Adjustment knobs and levers shall not interfere with the user’s range of movement.

7.11 *Handgrips/Foot Support:*

7.11.1 *General*—Handgrips and foot supports on outdoor fitness equipment shall not create protrusions or entrapment hazards. If surfaces are intended to be gripped for the execution of the exercise then they shall have a cross sectional dimension greater than 16.00 mm (0.63 in.) in any direction. Functional training grips are exempt from these requirements. Material used for gripping surfaces shall take into consideration environmental degradation and vandalism.

7.11.2 *Integral Handgrips*—Integral handgrips, if required for proper use as defined by the manufacturer, shall be conspicuous and shall reduce slippage during normal use and not create entrapment or entanglement points.
