This European Standard was approved by CEN on 1995-07-06. CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CEN member.

The European Standards exist in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Central Secretariat has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

Foreword

The text of the International Standard ISO 10634:1995 has been prepared by Technical Committee ISO/TC 147 "Water Quality" in collaboration with CEN/TC 230 "Water analysis".

This European Standard shall be given the status of a National Standard, either by publication of an identical text or by endorsement, at the latest by February 1996, and conflicting national standards shall be withdrawn at the latest by February 1996.

According to CEN/CENELEC Internal Regulations, the following countries are bound to implement this European Standard: Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom.

Endorsement notice

The text of the International Standard ISO 10634:1995 has been approved by CEN as a European Standard without any modification.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The workIST of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 10634 was prepared by Technical Committee ISO/TC 147, *Water quality*, Subcommittee SC 5, *Biological methods*.

Annex A of this International Standard is for information only.

Introduction

The standardizing work carried out by ISO/TC 147/SC 5 has shown that the development of a single method for evaluating the biodegradability of organic compounds with a low solubility in water may not be envisaged in the immediate future. In fact, the selection of the most suitable working method to obtain a satisfactory emulsion or dispersion of these compounds in the test media depends particularly on their physico-chemical properties. Consequently, the selection of the most suitable method has to be left to the judgement of laboratories responsible for the tests based on their experience and the product information supplied by the applicant. It is for this reason that this International Standard describes various techniques for treating poorly soluble organic compounds before they are investigated in biodegradability tests, with the aim of reaching a stage iTeh S where, for any given technique, the same working method is used by all aboratories, thus making it easier to compare results.

SThe techniques described in this International Standard do not necessarily produce the same results if they are used in parallel. The use of solvents and dispersing or emulsifying techniques may be additional sources of https://standards.ite and may lead to test results which differ from those obtained without using these techniques. Furthermore, dispersions or emulsions ⁷⁵ may be produced which would not exist as such in nature and where the rate and degree of biodegradability is enhanced because very fine particles are present. These facts have to be considered for the evaluation and interpretation of the results of biodegradation tests. It is recommended to perform biodegradability tests first, with the direct addition of a test compound, or to perform this test in parallel to tests using dispersion techniques.

> Normally, only pure or virtually pure compounds should be tested. If mixtures or multi-componental substances are tested, the use of solvents and dispersion techniques may lead to unrepresentative heterogeneous distributions and to misleading test results in the subsequent biodegradability tests.

Water quality — Guidance for the preparation and treatment of poorly water-soluble organic compounds for the subsequent evaluation of their biodegradability in an aqueous medium

1 Scope

This International Standard describes four techniques Normative references 2 for preparing poorly water-soluble organic compounds and introducing them into test vessels for a sub-The following standards contain provisions which, sequent test on biodegradability in an aqueous me-KI through reference in this text, constitute provisions dium using standard methods. The test compounds this International Standard. At the time of publicaconcerned are not sufficiently soluble in water to S. tion, the editions indicated were valid. All standards perform the biodegradability tests in the normal manner, as described in the respective test methods india 10634 are subject to revision, and parties to agreements https://standards.iteh.ai/catalog/standards/sistbased on (this4 International Standard are encouraged cated in clause 2. 75f7a7ef740f/sist-en-iso-1t03investigate the possibility of applying the most re-

The preparation techniques are as follows:

- direct addition (clause 3): this technique is restricted to non-volatile test compounds if inert supports or solvents are used;
- ultrasonic dispersion (clause 4): this technique may be applied to non-volatile liquid and solid compounds;
- adsorption on an inert support (clause 5);
- dispersions or emulsions with an emulsifying agent (clause 6).

The subsequent tests on biodegradability are primarily methods using the analysis of the released carbon dioxide (see ISO 9439) and the determination of the oxygen consumption (see ISO 9408). This International Standard does not describe the test methods; it is restricted to describing the techniques for introducing the test substances into the test medium and to keep them in a dispersed state. These techniques are implemented while observing the experimental conditions described in the standardized methods for evaluating biodegradability. It should be noted that volatile chemicals may not be tested by the carbon dioxide method specified in ISO 9439.

cent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 9408:1991, Water quality - Evaluation in an aqueous medium of the "ultimate" aerobic biodegradability of organic compounds — Method by determining the oxygen demand in a closed respirometer.

ISO 9439:1990, Water quality — Evaluation in an aqueous medium of the "ultimate" aerobic biodegradability of organic compounds — Method by analysis of released carbon dioxide.

3 **Direct addition**

Any of the following techniques can be used

- The test compound is weighed and directly introduced into the test vessels which are subjected to continuous agitation.

Some organic compounds which are spar-NOTE 1 ingly soluble in water dissolve more readily when alkali or acid is added. They may be introduced as an acid or
