

Designation: B907 – 16 (Reapproved 2021)

Standard Specification for Zinc, Tin and Cadmium Base Alloys Used as Solders¹

This standard is issued under the fixed designation B907; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers solder metal alloys (commonly known as soft solders), including zinc-aluminum, zinc-aluminum-copper, zinc-tin, zinc-tin-copper, zinc-cadmium-tin, zinc-cadmium, tin-zinc, cadmium-zinc, cadmium-zinc-silver, and cadmium-silver, used as solders for the purpose of joining together two or more metals at temperatures below their melting points.

1.1.1 Certain alloys specified in this standard are also used as Thermal Spray Wire in the electronics industry and are covered for this purpose in Specification B943. Specification B833 covers Zinc and Zinc Alloy Wire for Thermal Spraying (Metallizing) used primarily for the corrosion protection of steel (as noted in Annex A1 of this specification).

1.1.2 Tin base alloys are included in this specification because their use in the electronics industry is different than the major use of the tin and lead solder compositions specified in Specification B32.

1.1.3 These solders include alloys having a nominal liquidus temperature not exceeding 850°F (455°C).

1.1.4 This specification includes solder in the form of solid bars, ingots, wire, powder and special forms, and in the form of solder paste.

1.2 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.

1.3 **Toxicity—Warning**—Soluble and respirable forms of cadmium may be harmful to human health and the environment in certain forms and concentrations. Therefore, ingestion and inhalation of cadmium should be controlled under the appropriate regulations of the U.S. Occupational Safety and Health Administration (OSHA). Cadmium-containing alloys and coatings should not be used on articles that will contact food or beverages, or for dental and other equipment that is normally inserted in the mouth. Similarly, if articles using cadmium-containing alloys or coatings are welded, soldered, brazed,

ground, flame-cut, or otherwise heated during fabrication, adequate ventilation must be provided to maintain occupational cadmium exposure below the OSHA Permissible Exposure Level (PEL).

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to become familiar with all hazards including those identified in the appropriate Safety Data Sheet (SDS) for this product/material as provided by the manufacturer, to establish appropriate safety, health, and environmental practices, and determine the applicability of regulatory limitations prior to use.*

1.5 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

^A For purposes of acceptance and rejection, the observed value or calculated value obtained from analysis should be rounded to the nearest unit in the last right-hand place of figures, used in expressing the specified limit, in accordance with the rounding procedure prescribed in Practice E29.

^B All values not given as a range are maximum values unless stated otherwise.

^C Remainder (REM) determined arithmetically by difference.

^D The UNS designations were established in accordance with Practice E527. The last digit of a UNS number differentiates between alloys of similar composition.

^E These alloys are listed with the zinc base alloys even though they contain significant amounts of cadmium because their use is similar to those of the other alloys in Table 1A.

2.2 *Federal Standard*:⁴

[Fed. Std. No. 123 Marking for Shipment \(Civil Agencies\)](#)

2.3 *ISO Standards*:⁵

[ISO 3815-1 Zinc and zinc alloys — Part 1: Analysis of solid samples by optical emission spectrometry](#)

[ISO 3815-2 Zinc and zinc alloys — Part 2: Analysis by inductively coupled plasma optical emission spectrometry](#)

2.4 *Military Standard*:⁴

[Mil-Std-129 Marking for Shipment and Storage](#)

3. Terminology

3.1 Terms shall be defined in accordance with Terminology B899.

4. Classification

4.1 *Type Designation*—The type designation uses the following symbols to properly identify the material:

⁴ Available from DLA Document Services, Building 4/D, 700 Robbins Ave., Philadelphia, PA 19111-5094, <http://quicksearch.dla.mil>.

⁵ Available from American National Standards Institute (ANSI), 25 W. 43rd St., 4th Floor, New York, NY 10036, <http://www.ansi.org>.

TABLE 2 Form

Symbol	Form
B	Bar
I	Ingot
P	Powder
R	Ribbon
S	Special ⁴
W	Wire

⁴ Includes pellets, preforms, etc.

4.1.1 *Alloy Composition*—The composition is identified by a two or four-letter symbol and a number. The letters typically indicate the chemical symbol for the critical element in the solder and the number indicates the nominal percentage, by weight, of the critical element in the solder (see [Table 1](#)).

4.1.2 *Form*—The form is indicated by a single letter in accordance with [Table 2](#).

4.1.3 *Powder Mesh Size (applicable only to solder paste)*—The powder mesh size is identified by a single letter in accordance with [Table 3](#).

5. Ordering Information

5.1 Orders for material under this specification indicate the following information, as required, to adequately describe the desired material.

- 5.1.1 Type designation (see [4.1](#)),
- 5.1.2 Detailed requirements for special forms,
- 5.1.3 Dimensions of ribbon and wire solder (see [9.2](#)),
- 5.1.4 Unit weight,
- 5.1.5 Packaging (see [Section 18](#)),
- 5.1.6 Marking (see [Section 17](#)),
- 5.1.7 ASTM Specification number and issue, marked on (a) purchase order and (b) package or spool, and
- 5.1.8 Special requirements, as agreed upon between supplier and purchaser.

6. Materials and Manufacture

- 6.1 See [Specification B949](#).

7. Chemical Composition

7.1 *Solder Alloy*—The solder alloy composition is as specified in [Table 1](#).

NOTE 1—By mutual agreement between supplier and purchaser, analysis may be required and limits established for elements or compounds not specified in [Table 4](#).

8. Physical Properties and Performance Requirements

8.1 *Solder Paste*—Solder paste must exhibit smoothness of texture (no lumps) and the absence of caking and drying during storage and application. Some applications may require a fast drying formulation.

8.1.1 *Powder Mesh Size*—The solder powder mesh size shall be as specified (see [4.1.3](#)) when the extracted solder powder is tested as agreed upon between supplier and purchaser.

8.1.2 *Viscosity*—The viscosity of solder paste and the method used to determine the viscosity must be agreed upon between the supplier and the purchaser.

TABLE 3 Powder Mesh Size

Size Symbol	Powder Mesh Size
A	<325
B	<200
C	<100
D	<60

TABLE 4 Frequency of Sampling

Size of Lot, lb (kg)	Number of Samples (spools, coils, containers or pieces)
Up to 1000 (450), incl	3
Over 1000 to 10 000 (450 to 4500), incl	5
Over 10 000 (4500)	10

8.2 The following variables must be taken into account when relating one viscosity measurement to another: type of viscometer used, spindle size and shape, speed (r/min), temperature and the recent mixing history of the sample, and the use or non-use of a helipath.

9. Dimensions and Unit Weight

9.1 *Bar and Ingot Solder*—The dimensions and unit weight of bar and ingot solder will be as agreed upon between supplier and purchaser.

9.2 *Wire Solder*—The dimensions and unit weight of wire solder are specified in [5.1.3](#) and [5.1.4](#). The tolerance on specified outside diameter shall be $\pm 5\%$ or ± 0.002 in. (0.05 mm), whichever is greater.

9.3 Other forms:

9.3.1 Dimension for ribbon and special forms will be agreed upon between supplier and purchaser.

9.3.2 The unit weight of solder paste is specified in [5.1.4](#).

10. Workmanship, Finish, and Appearance

- 10.1 See [Specification B949](#).

11. Sampling

11.1 Care must be taken to ensure that the sample selected for testing is representative of the material. The method for sampling consists of one of the following methods:

11.1.1 Samples taken from the final solidified cast of fabricated product.

11.1.2 Representative samples obtained from the lot of molten metal during casting. The molten sample is poured into a cool mold, forming a bar approximately $\frac{1}{4}$ in. (6.4 mm) thick.

11.2 *Frequency of Sampling*—Frequency of sampling for determination of chemical composition shall be in accordance with [Table 4](#). For spools and coils, the sample is obtained by cutting back 6 ft (1.8 m) of wire from the free end and then taking the next 6 ft for test. In other forms, an equivalent sample is selected at random from the container.

11.3 *Other aspects of Sampling*—Other aspects of sampling conforms in the case of bar and ingots, to [Practice E88](#). For fabricated solders the appropriate reference is [Practice E55](#).

12. Specimen Preparation

12.1 *Solid Ribbon and Wire Solder*—Each sample of solid ribbon and wire solder is prepared in accordance with 12.1 as applicable.

12.2 *Bar and Ingot Solder*—Each sample piece is cut in half and one half marked and held in reserve. The remaining half is melted in a clean container, mixed thoroughly and poured into a cool mold, forming a bar approximately $\frac{1}{4}$ in. (6.4 mm) thick. Sampling is performed by one of the following methods:

12.3 *Sawing*—Saw cuts are made across the bar at equal intervals of not more than 1 in. (2.5 cm) throughout its length. If it is impractical to melt the bar or ingot as specified above, saw cuts are made across each piece at equal intervals of not more than 1 in. (2.5 cm) throughout its length. No lubricants are used during sawing. The specimen consists of not less than 5 oz (143 g).

12.4 *Drilling*—The bar is drilled at least halfway through from the opposite sides. A drill of about $\frac{1}{2}$ in. (12.7 mm) in diameter is preferred. In drilling, the holes are placed along a diagonal line from one corner of the ingot to the other. The drillings are clipped into pieces not over $\frac{1}{2}$ in. (12.7 mm) in length and mixed thoroughly. The specimen consists of not less than 5 oz (143 g).

13. Test Methods

13.1 Visual and Dimensional Examination

13.1.1 *Ribbon and Wire Solder*—Ribbon and wire solder must be examined to verify that the dimensions, unit weight, and workmanship are in accordance with the applicable requirements.

13.1.2 *Solder Paste*—Solder paste must be examined for smoothness of texture (no lumps), caking, drying, unit weight, and workmanship in accordance with the applicable requirements.

13.1.3 *Bar and Ingot Solder*—Bar and ingot solder must be examined to verify that the unit weight, marking, and workmanship are in accordance with the applicable requirements.

13.2 *Alloy Composition*—In case of dispute, the chemical analysis is made in accordance with Test Methods E46, E51, E87, E536, ISO 3815-1, or ISO 3815-2.

14. Inspection

14.1 See Specification B949.

15. Rejection and Rehearing

15.1 See Specification B949.

16. Certification

16.1 See Specification B949.

17. Product Marking

17.1 See Specification B949.

17.2 The producer's name or trademark must be stamped or cast on each bar or ingot. The alloy grade designation or nominal composition, or both, must be stamped on each bar or ingot for identification along with the specification number.

17.3 Each spool or container must be marked to show the specification number, type designation, dimensions, and unit weight of wire or other form and lot number. The producer's name or trademark must be marked on the spool or container.

18. Packaging and Package Marking

18.1 The material must be packaged to provide adequate protection during normal handling and transportation. The type of packaging and gross weight of containers will, unless otherwise agreed upon, be at the producer's or supplier's discretion, provided that they are such as to ensure acceptance by common or other carriers for safe transportation to the delivery point.

18.1.1 For bar and ingot solder a lot number must be marked on each shipping container or inside package.

18.1.2 When special preservation, packaging and packing requirements are agreed upon between purchaser and supplier, marking for shipment of such material must be in accordance with Fed. Std. No. 123 for civil agencies and MIL-STD-129 for military agencies.

18.2 Each shipping container must be marked with the purchase order number, unit weight, and producer's name or trademark.
