

Designation: ~~E2020~~—16 E2020 – 22

Standard Guide for Data and Information Options for Conducting an Ecological Risk Assessment at Contaminated Sites¹

This standard is issued under the fixed designation E2020; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reappraisal. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reappraisal.

1. Scope

1.1 An ecological-risk assessment (ERA) is a process for organizing and analyzing data, information, assumptions, and uncertainties to evaluate the likelihood that adverse ecological effects might occur or are occurring as a result of a stressor. This guide is intended to assist remedial project teams, specifically ecological risk assessors, in identifying data and information options that may be used to perform a screening or complex ecological risk assessment (ERA) at a contaminated site.

NOTE 1—While the intent of ERA is to evaluate risk (that is, the probability of adverse effects occurring in ecological receptors), there are no measures, statistics, or metrics that calculate or express risk explicitly. However, various metrics or indices, a common example being the hazard quotient, are used to inform risk assessments.

1.2 The identification of data and information options for human health risk assessment is outside the scope of this guide.

1.3 This guide is intended to provide a list for identifying data and information options and does not recommend a specific course of action for ERA activities.

1.4 This guide addresses data and information options for the ecological risk assessment, not verification or long-term monitoring studies.

1.5 This guide lists many of the common data and information options for ERA, but there may be others relevant for any particular site.

1.6 This guide considers one component of an ERA, that is, identification of data and information options. Other ASTM guides have been developed, for example, Guides **E1689** and **E1848**, and are being developed to cover other components of the risk assessment process.

1.7 This guide does not provide information on how to perform any of the analytical procedures used to perform a risk assessment once data collection options are defined.

1.8 This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.

¹ This guide is under the jurisdiction of ASTM Committee **E50** on Environmental Assessment, Risk Management and Corrective Action and is the direct responsibility of Subcommittee **E50.05** on Environmental Risk Management.

Current edition approved Oct. 1, 2016; Jan. 1, 2022. Published December 2016; February 2022. Originally approved in 1999. Last previous edition approved 2010 as E2020-99a (2010)—16. DOI: 10.1520/E2020-16:10.1520/E2020-22.

3. Terminology

3.1 *Definitions of Terms Specific to This Standard:*

3.1.1 *assessment endpoint, n*—an explicit expression of the environmental value to be protected.

3.1.2 *baseline condition, n*—the initial physical, biological, and environmental condition of the project area, prior to intervention or disruption.

3.1.2.1 *Discussion—*

The baseline condition may include soil properties, the geological characteristics, the topography, watershed properties, the initial level of environmental impairment of water, air, soil, sediment, the biodiversity of the area, types of flora and fauna, species richness, species distribution, types of ecosystems, presence or absence of endangered species and/or sensitive ecosystems etc.

3.1.3 *baseline ecological risk assessment, n*—an ecological risk assessment completed using quantitative methods, which relies on site-specific data and may include toxicity testing, field biological surveys, and probabilistic analysis.

3.1.4 *bioaccumulation, n*—the net increase of contaminant concentrations in organisms following uptake from the ambient environmental medium.

3.1.4.1 *Discussion—*

Different sources of exposure contribute to contaminant bioaccumulation.

3.1.5 *chemical stressor, n*—a chemical, chemical mixture, or radionuclide present in an environmental medium that is known or suspected to induce an adverse biological, toxicological, or ecological response in an exposed ecological receptor.

3.1.6 *complex ecological risk assessment, n*—an ecological risk assessment completed using quantitative methods, which relies on site-specific data and may include toxicity testing, field biological surveys, and probabilistic analysis.

3.1.7 *data quality objective, n*—a specification of the amount and quality of data required to adequately complete the risk assessment such that a risk management decision can be made.

² For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For *Annual Book of ASTM Standards* volume information, refer to the standard's Document Summary page on the ASTM website.

³ The last approved version of this historical standard is referenced on www.astm.org.

⁴ Available from International Organization for Standardization (ISO), ISO Central Secretariat, Chemin de Blandonnet 8, CP 401, 1214 Vernier, Geneva, Switzerland, <https://www.iso.org>.

⁵ Available from United States Environmental Protection Agency (EPA), William Jefferson Clinton Bldg., 1200 Pennsylvania Ave., NW, Washington, DC 20460, <http://www.epa.gov>.

3.1.8 *ecological receptor*, *n*—ecosystems, communities, populations, and individual organisms (except humans), that can be exposed directly or indirectly to site stressors.

3.1.9 *ecological-risk assessment (ERA)*—a process for organizing and analyzing data, information, assumptions, and uncertainties to evaluate the likelihood that adverse ecological effects might occur or are occurring as a result of a stressor.

3.1.10 *measurement endpoint*, *n*—a measurable response to a stressor that is quantifiably related to the valued characteristic chosen as the assessment endpoint.

3.1.11 *non-chemical stressor*, *n*—a biological agent, physical disturbance, condition, or nonchemical characteristic of a waste material, substrate, or source associated with a contaminated site and corrective actions that is known or suspected to interfere with the normal functioning of an ecological receptor.

3.1.12 *screening ecological risk assessment*, *n*—an ecological risk assessment completed using qualitative or simple quantitative methods, which relies on literature information and is unlikely to include toxicity testing, field biological surveys, or probabilistic analysis.

3.1.13 *site*, *n*—the terms “site,” “on-site,” and “off-site,” have not been defined in this guide. They will need to be defined on a case-by-case basis. They could be defined by regulatory needs, natural boundaries, or property boundaries.

3.2 Acronyms:

3.2.1 *CEC*—Cation Exchange Capacity

3.2.2 *DOC*—Dissolved Organic Carbon

3.2.3 *DQO*—Data Quality Objective

3.2.4 *EPA / USEPA*—United States Environmental Protection Agency

3.2.5 *ERA*—Ecological Risk Assessment

3.2.6 *GIS*—Geographic Information System

3.2.7 *PCB*—Polychlorinated Biphenyls

3.2.8 *TDS*—Total Dissolved Solids

3.2.9 *TOC*—Total Organic Carbon

3.2.10 *TSS*—Total Suspended Solids

4. Summary of Guide

4.1 This guide provides a series of lists of data and information options for conducting an ecological risk assessment at a contaminated site and is organized in accordance with the major components of the risk assessment process: problem formulation, exposure characterization, effects characterization, and risk characterization (1-4).⁶ Lists are provided for screening and complex ERAs.

5. Significance and Use

5.1 This guide is significant in that it addresses the data and information options of each component of the ecological risk assessment process, for both a screening and complex ERA. It outlines the data and information options while recognizing that

⁶ The boldface numbers in parentheses refer to the list of references at the end of this standard.

an ecological risk assessment may be focused to achieve a particular stated goal. This guide is not intended to represent the views of the U.S. Environmental Protection Agency (USEPA), or any other regulatory agency, on data collection for ecological risk assessment.

5.2 This guide is to be used by managers, scientists, and technical staff of contractors, industry, government agencies, and universities responsible for conducting ecological risk assessments at contaminated sites. It is to be used to guide data collection phases of the ecological risk assessment. It will assist in the development of the conceptual site model (see Guide E1689) and the identification of potential assessment and measurement endpoints (see Guide E1848 and US EPA’s Generic Ecological Assessment Endpoints, 2016 (5)). While it was written to assist in planning an ERA, the list also may be used in the review of a completed ERA.

6. General Guidance on Determining Data Collection Options for Ecological Risk Assessment

6.1 It is imperative that the goals of the ERA are outlined at the beginning of the ERA process. Data collection efforts may then be focused to ensure a sound scientific approach and cost-effective use of resources, for example, time and money.

6.2 The lists are not meant to be exhaustive. Neither are they intended to be lists of data required for all ERAs. The amount and type of data required for a screening or complex ERA will depend upon the size and location of the site, the future intended use of the site, the complexity baseline condition of the site, and the outcome of the data quality objectives (DQO) process (56). A typical site may utilize only a small percentage of these data and information options. These lists are intended to serve as a general index to data collection efforts.

6.2.1 Data Collection should include the type of habitat determination (critical, occupied, unoccupied) and the location of the habitat to ensure proper data collection of ecological indicators.

7. Lists

7.1 Not all of the components within the following lists will be relevant at every contaminated site. In addition, some information may be site-specific and other information may be obtained from the literature. Literature data are more prevalent in screening ERAs and site-specific data are more prevalent in complex ERAs. Whenever practicable, site-specific data are preferred over literature data.

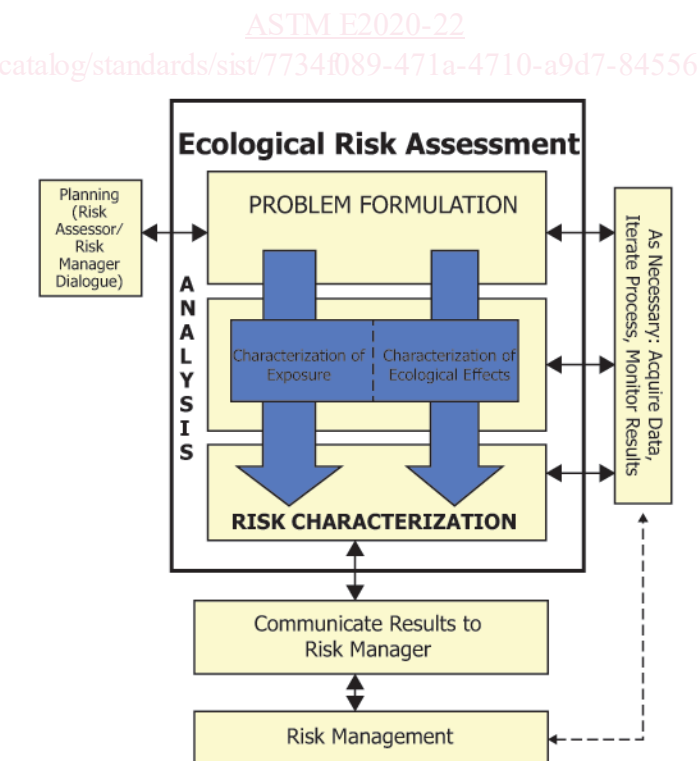

FIG. 1 Source EPA’s Guidelines for Ecological Risk Assessment, April 1998. (EPA/630/R-95/002F)

7.2 The options in the lists are not in any particular order. Risk assessment often is an iterative process, and it may be more scientifically sound and cost-effective to complete certain options before others. The order for the completion of options will need to be determined on a case-by-case basis.

8. Data Options for Problem Formulation

8.1 Most of the data and information options in problem formulation are applicable to both screening and complex ERAs and are outlined below; however, the information will be more detailed in a complex ERA. Additional data and information options typically found only in complex ERAs are listed in Section 9.

8.2 Clearly define the goals of the ERA (67).

8.3 Define data quality objectives (DQOs) for the assessment see Ref:(56).

8.3.1 State the problem that the risk assessment should address.

8.3.2 Identify the decision(s) that require new environmental data to address the contamination problem.

8.3.3 Identify the inputs (data or information) needed to support the decision.

8.3.4 Define the scale (spatial and temporal) of the assessment.

8.3.5 Develop a decision rule that defines choice among alternative solutions.

8.3.6 Specify acceptable limits on decision errors used to establish performance goals for limiting uncertainty.

8.3.7 Optimize the design for obtaining data, by identifying the most resource-effective sampling and analysis plan.

8.3.8 Identification of indicator species for specific habitats.

8.3.9 Identification of additional considerations for threatened and endangered species.

8.4 Complete the conceptual site model (see Guide E1689) or ISO 21365:2019)

8.4.1 Identify the current and historical sources of potential chemical stressors, such as the following:

8.4.1.1 Process areas;

8.4.1.2 Landfill;

8.4.1.3 Burial ground;

8.4.1.4 Underground or aboveground storage tanks, or both;

8.4.1.5 Lagoons;

8.4.1.6 Holding ponds;

8.4.1.7 Air stacks or other air emission sources;

8.4.1.8 Effluent pipes; or,

8.4.1.9 Historical spills or accidental releases.

8.4.2 Identify nonchemical, for example, physical and biological stressors, such as the following:

8.4.2.1 Nonnative or exotic species;

8.4.2.2 Pathogens;

8.4.2.3 Temperature;

8.4.2.4 Suspended solids;

8.4.2.5 Change in water levels;

8.4.2.6 Oxygen depletion;

8.4.2.7 pH;

8.4.2.8 Predators;

8.4.2.9 Habitat alteration, degradation or destruction; or,

8.4.2.10 Non-site-related stressors, for example, local releases from municipal or industrial development.

8.4.3 Identify potential constituent migration pathways.

8.4.4 Identify geological features that control movement of constituents and dictate exposure pathways. In particular, note any features which would cause unpredictable movement of constituents, for example, karst formations in limestone often cause difficulties in tracing ground water movement.

8.4.5 Identify all relevant constituent-bearing media, such as the following:

8.4.5.1 Soil;

8.4.5.2 Ground water;

8.4.5.3 Surface water;

8.4.5.4 Sediment;

8.4.5.5 Air; or,

8.4.5.6 Biota.

8.4.6 Identify direct and indirect complete exposure pathways. Ensure that exposure pathways are identified appropriately, for example, PCBs may not be detected in surface water, but may be detected in fish tissues, and therefore, food web exposure pathways are appropriate to consider. Exposure pathways may include the following:

8.4.6.1 Inhalation;

8.4.6.2 Ingestion;

8.4.6.3 Dermal uptake;

8.4.6.4 Root uptake; or,

8.4.6.5 Food web.

8.4.7 Identify normal and atypical weather patterns for the site location, such as the following:

8.4.7.1 Excessive dry periods with high winds may lead to increased levels of constituents in air from fugitive dusts, and destruction of habitat;

8.4.7.2 Storm events, for example, hurricanes, that may mobilize constituents, for example, suspension of sediments may increase the bioavailability of constituents;

8.4.7.3 Periodic flooding may result in certain exposure pathways that may otherwise not exist, for example, contamination of the floodplain community from a stream; or,

8.4.7.4 Fluctuations in salinity.

8.4.8 Define the assessment endpoints and include rationale for their selection (see Guide [E1848](#) and [EPA Procedures For Delineating And Characterizing Watersheds For Stream And River Monitoring Programs, 2018](#)).

8.4.8.1 Ensure the assessment endpoints are relevant to decision-making. (78)

8.4.8.2 Consider whether endpoints are ecologically relevant.

8.4.8.3 Consider whether endpoints have societal importance.

8.4.8.4 Determine whether endpoint species are or could be at the site.

8.4.8.5 Consider whether endpoint species are sensitive to site constituents.

8.4.8.6 Consider whether endpoint species are likely to receive high exposures.

8.4.9 Identify any threatened, or endangered species (plant or animal), or both, known to inhabit, or that could potentially inhabit, the vicinity of the site. Also, identify the presence of habitat that could be utilized by threatened and endangered species. Consider using state or federal listings of threatened, rare and endangered species, for example, Natural Heritage Program. Consider local laws and regulations to identify any protected species or species of local concern.

8.4.10 Identify any commercially or recreationally important species in the area of the site.

8.4.11 Describe the food web. Identify multiple food sources, where appropriate, in the foraging area of each receptor species. Consider consulting with local naturalists, for example, Department of Natural Resources, Fish and Wildlife Service, Department of Environmental Protection, Natural Heritage Program, to obtain information on local species.

NOTE 2—Graphic representation of the food web is recommended.

8.4.12 Define measurement endpoints and include rationale for their selection. Also, describe relation between assessment endpoints and measurement endpoints.

8.4.13 Present both current and future exposure scenarios. Future exposures should be based on reasonably anticipated future land use. Describe how future exposures may change, as a result of the following scenarios, for example:

8.4.13.1 Increased release from a ground water plume to a stream;

8.4.13.2 Increased habitat from forest succession causes additional ecological receptor species to be in contact with constituents;

8.4.13.3 Decreased exposure because of scouring of sediments out of a stream, but increased exposure downstream where sediments settle;

8.4.13.4 Weather-related seasonal or periodic changes; or,

8.4.13.5 Continued physical degradation or biodegradation of constituents.
