

Designation: F2194 – 22^{ε1}

Standard Consumer Safety Specification for Bassinets and Cradles¹

This standard is issued under the fixed designation F2194; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

^{ε1} NOTE—Editorial corrections were made throughout in July 2022.

INTRODUCTION

This consumer safety performance specification addresses infant bassinet and cradle incidents identified by the U.S. Consumer Product Safety Commission (CPSC).

In response to the incident data compiled by the CPSC, this consumer safety performance specification attempts to minimize the following hazards: (1) suffocation, (2) tip over, (3) collapse, and (4) hood detachment. It also addresses corner post extensions, which may catch pacifier cords, ribbons, necklaces, or clothing which a child may be wearing and which may be caught on a projection. This specification does not cover products that are blatantly misused or used in a careless manner that disregards the safety instructions and warnings provided with each bassinet or cradle.

1. Scope

1.1 This consumer safety specification covers performance requirements, test methods, and marking requirements to promote safe use of bassinets and cradles.

1.2 This consumer safety performance specification is intended to minimize the risks of incidents to an infant resulting from normal use and reasonably foreseeable misuse of a bassinet or cradle.

1.3 This consumer safety performance specification covers products primarily intended to provide sleeping accommodations for an infant up to approximately 5 months in age or when the child begins to push up on hands and knees, whichever comes first.

1.3.1 *Examples of Products under the Scope:*

1.3.1.1 Bassinets, cradles, compact bassinets, and compact cradles.

1.3.1.2 Cradle swings with an incline less than or equal to 10° from horizontal while in the rest (non-rocking) position.

1.3.1.3 Multi-use products when they are in the bassinet/cradle or compact bassinet/cradle use mode as defined in 3.1.1 or 3.1.3.

1.3.1.4 Bassinet/cradle accessories to products when removed from the product and used in the bassinet/cradle mode or as a compact bassinet/cradle product. See 3.1.2 for an example.

¹ This specification is under the jurisdiction of ASTM Committee F15 on Consumer Products and is the direct responsibility of Subcommittee F15.18 on Cribs, Toddler Beds, Play Yards, Bassinets, Cradles and Baby Changing Products.

Current edition approved Jan. 1, 2022. Published June 2022. Originally approved in 2002. Last previous edition approved in 2016 as F2194 – 16^{ε1}. DOI: 10.1520/F2194-22E01.

1.3.1.5 Bassinet/cradle features for carriage/stroller when removed from the carriage/stroller and used in the bassinet/cradle mode or compact bassinet/cradle product mode.

1.3.2 *Examples of Products Excluded from the Scope:*

1.3.2.1 Sleep products that have only inclined sleeping surfaces intended to be greater than 10° from horizontal while in the rest (non-rocking) position.

1.3.2.2 In-bed portable sleepers.

1.3.2.3 Enclosed travel tents.

1.4 No bassinet or cradle produced after the approval date of this consumer safety performance specification shall, either by label or other means, indicate compliance with this specification unless it conforms to all requirements contained herein.

1.5 This consumer safety performance specification is not intended to address incidents and injuries resulting from alteration or unreasonable abuse or misuse of the product by a child or child care giver.

1.6 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.

1.7 The following precautionary caveat pertains only to the test method portion Section 7 of this consumer safety performance specification *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.

3. Terminology

3.1 Definitions:

3.1.1 *bassinet/cradle, n*—small bed designed primarily to provide sleeping accommodations for infants, supported by free standing legs, a stationary base/stand, a wheeled base, a rocking base, or a base which can swing relative to a stationary base. While in a rest (non-rocking or swinging) position, a

FIG. 2 CAMI Newborn Dummy 7.5 lb (3.4 kg)

1.8 This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recom-

bassinet/cradle is intended to have a sleep surface less than or equal to 10° from horizontal.

3.1.1.1 *bassinet bed, n*—the sleeping area of the bassinet/cradle, containing the sleep surface and side walls.

3.1.1.2 *false latch/lock visual indicator, n*—a warning system using contrasting colors, lights, or other similar means designed to visually alert caregivers when a removable bassinet bed is not properly locked onto its base/stand.

3.1.1.3 *intended use orientation*—the bassinet bed orientation (that is, the position where the head and foot ends of the bassinet bed are located) with respect to the base/stand, as recommended by the manufacturer for intended use.

3.1.1.4 *removable bassinet bed, n*—a bassinet bed that is designed to separate from the base/stand without the use of tools. This definition does not include the play yard bassinet as defined in 3.1.15.

3.1.2 *bassinet/cradle accessory, n*—a supported sleep surface that attaches to a crib or play yard designed to convert the product into a bassinet/cradle or into compact bassinet/cradle intended to have a sleep surface less than or equal to 10° from horizontal while in a rest (non-rocking or swinging) position.

3.1.3 *compact bassinet/cradle, n*—a bassinet/cradle having a distance of less than 6.0 in. (152.4 mm) between the lowest point of the underside of the sleep surface support and the product support surface (floor).

3.1.3.1 *Discussion*—This includes a bassinet/cradle that may have hand-holds, handle(s), or grip openings and is intended to carry an occupant whose torso is completely supported by the product. This also includes products commonly known as Moses baskets.

3.1.4 *conspicuous, adj*—visible, when the product is in all manufacturer's recommended use positions, to a person standing near the product at any one position around the product but not necessarily visible from all other positions.

3.1.5 *double-action release mechanism, n*—mechanism requiring either two consecutive actions, the first of which must be maintained while the second is carried out or two separate and independent single-action locking mechanisms that must be activated simultaneously to fully release.

3.1.6 *fabric, n*—any woven, knit, coated, laminated, extruded, or calendared flexible material that is intended to be sewn, welded, heat sealed, or glued together as an assembly.

3.1.7 *manufacturer's recommended use position, n*—any position that is presented as a normal, allowable, or acceptable configuration for the use of the product by the manufacturer in any descriptive or instructional literature. This specifically excludes positions that the manufacturer shows in a like manner in its literature to be unacceptable, unsafe, or not recommended.

3.1.8 *mattress, n*—pad with a fabric, vinyl, or other material case filled with resilient material (such as cotton, foam, fiberfill, etc.) used as or on the floor of the unit.

3.1.9 *mattress support rods/bars, n*—component(s), typically rods or bars, that provide added support between the mattress support component and the mattress.

3.1.10 *maximum deflection angle, n*—the maximum rock/swing angle measurement allowed by the product design in the manufacturer's recommended use position in the manner normally associated with rocking/swinging as intended by the manufacturer.

3.1.11 *mesh, n*—mesh may be either a woven fabric in which the warp and filling yarns are interlaced, knitted fabric in which the wales and courses yarns are interlocked, or any other type of fabric that may be developed that provides openings therein.

3.1.12 *non-paper label, n*—any label material (such as plastic or metal) that either will not tear without the aid of tools or tears leaving a sharply defined edge.

3.1.13 *occupant, n*—that individual who is in a product that is set up in one of the manufacturer's recommended use positions.

3.1.14 *paper label, n*—any label material that tears without the aid of tools and leaves a fibrous edge.

3.1.15 *play yard bassinet, n*—bassinet accessory usually suspended in the upper portion of the play yard and typically has a folding or segmented mattress, or both.

3.1.16 *removable cover, n*—a fabric cover encompassing the recommended sleeping area for the occupant of the product, that uses snaps, zippers, hook and loop, buttons or other fasteners to attach to a bassinet/cradle frame that requires consumer action as a step for removal or adjustment.

3.1.17 *rest angle, n*—the resulting angle measurement of the bassinet/cradle sleeping surface after the maximum deflection angle is applied and released and the product has come to a complete rest.

3.1.18 *seam, n*—means for joining fabric components, such as sewing, welding, heat sealing, or gluing.

3.1.19 *static load, n*—vertically downward force applied by a calibrated force gauge or by dead weights.

4. Calibration and Standardization

4.1 All testing shall be conducted on a concrete floor that may be covered with 1/8-in. (3-mm) thick vinyl flooring cover, unless the test instructs differently.

4.2 The product shall be completely assembled, unless otherwise noted, in accordance with the manufacturer's instructions.

4.3 No testing shall be conducted within 48 h of manufacturing.

4.4 The product to be tested shall be in a room with ambient temperature of 73 °F ± 9 °F (23 °C ± 5 °C) for at least 1 h prior to testing. Testing then shall be conducted within this temperature range.

4.5 All testing required by this specification shall be conducted on the same unit.

4.6 Angle measurements shall be obtained using a digital inclinometer capable of 0.1° minimum resolution.

4.7 A force gauge with a minimum range of 0 lbf to 25 lbf (110 N), accuracy of ±0.25 lb.

5. General Requirements

5.1 *Lead in Paints*—The paint or surface coating on the product shall comply with 16 CFR 1303.

5.2 *Hazardous Sharp Edges or Points*—There shall be no hazardous sharp points or edges as defined by 16 CFR 1500.48 and 16 CFR 1500.49 before and after testing to this consumer safety specification.

5.3 *Small Parts*—There shall be no small parts as defined by 16 CFR 1501 before testing or liberated as a result of testing to this specification.

5.4 *Wood Parts*—Prior to testing, any exposed wood parts shall be smooth and free of splinters.

5.5 *Scissoring, Shearing, or Pinching*—A product, when in the manufacturer's recommended use position shall be designed and constructed so as to prevent injury to the occupant from scissoring, shearing, or pinching when members or components rotate about a common axis, or fastening points, slide, pivot, fold or otherwise move relative to one another. Scissoring, shearing, or pinching that may cause injury shall not be permissible when the edges of any rigid parts admit a probe that is greater than a 0.210-in. (5.33-mm) and less than a 0.375-in. (9.53-mm) diameter at any accessible point throughout the range of motion of such parts.

5.6 Unintentional Folding:

5.6.1 Products designed without latching or locking devices must remain in the manufacturer's recommended use position during and upon completion of the test, in accordance with 7.5.1.

5.6.2 Products designed with a single-action release mechanism latching or locking devices must remain in the manufacturer's recommended use position during and upon completion of the test, in accordance with 7.5.2.

5.6.3 Products with a double-action release mechanism latching or locking device shall require two distinct and separate actions for release of the mechanism.

5.7 *Openings*—Holes or slots that extend entirely through a wall section of any rigid material less than 0.375-in. (9.53-mm) thick and admit a 0.210-in. (5.33-mm) diameter rod shall also admit a 0.375-in. (9.53-mm) diameter rod. Holes or slots that are between 0.210-in. (5.33-mm) and 0.375-in. (9.53-mm) and have a wall thickness less than 0.375 in. (9.53 mm) but are limited in depth to 0.375-in. (9.53-mm) maximum by another rigid surface shall be permissible (see Fig. 3). The product shall be evaluated in all manufacturer's recommended use positions.

5.8 Labeling:

5.8.1 Warning labels (whether paper or non-paper) shall be permanent when tested in accordance with 7.2.1 – 7.2.3.

5.8.2 Warning statements applied directly onto the surface of the product by hot stamping, heat transfer, printing, wood burning, etc. shall be permanent when tested in accordance with 7.2.4.1 – 7.2.4.3.

5.8.3 Non-paper labels shall not liberate small parts when tested in accordance with 7.2.5.

5.9 *Fasteners*—Woodscrews shall not be used in the assembly of any components that must be removed by the consumer in the normal disassembly of a bassinet/cradle.

5.10 Corner Posts:

5.10.1 No corner post assembly shall extend more than 0.06 in. (1.5 mm) above the upper edge of an end or side panel, whichever is higher, when measured from the lowest point on the upper edge of the end panel within 3 in. (76 mm) from the outermost contour of the elbow (see Fig. 4).

5.10.2 The limitations in 5.10.1 do not apply to a corner post assembly that extends at least 16 in. (406 mm) above the uppermost surface of the side rail in its highest position.

5.10.2.1 Corner posts intended to accept removable vertical extensions made up of two or more segments (such as canopy post extensions) shall not permit the attachment of individual segments such that the resultant vertical extension would be in violation of the dimensional requirements of 5.10.2.

5.11 *Toys*—Toy accessories attached to, removable from, or sold with a bassinet or cradle, as well as their means of attachment, must meet the applicable requirements of Consumer Safety Specification F963.

5.11.1 Toy mobiles that attach solely to a bassinet or cradle are not required to contain labeling as stated in Consumer Safety Specification F963, Section 5.6.2 (Safety Labeling Mobiles).

5.12 *Bassinet/Cradle Accessory to Play Yard/Non-Full-Sized Crib*—A bassinet accessory intended to be attached to, removable from, sold with or separately from a play yard or non-full-sized crib shall comply with the requirements of this specification and Consumer Safety Specification F406 when attached in the manufacturer's recommended use position.

5.13 *Occupant Restraint System*—No product shall contain a restraint system in the occupant area when used in the bassinet/cradle mode.

5.14 If the bassinet/cradle or compact bassinet/cradle product can be converted into another product for which a consumer safety specification exists, the product shall comply with the applicable requirements of that standard when in that use mode.

6. Performance Requirements

6.1 *Spacing of Rigid Sided Bassinet/Cradle Components*—Spacing must comply with the applicable sections of 16 CFR 1220 when tested according to 7.1.

6.2 *Openings for Mesh/Fabric Sided Bassinet/Cradle*—Openings in the mesh shall be designed to prevent entrapment of fingers, toes, and snaring of buttons normally used on infant clothing. A mesh opening shall not fully accept the specified rod when tested in accordance with 7.6.

6.3 *Static Load*—A product shall support the static load without causing any hazardous conditions as identified within Section 5 of this consumer safety specification. This test shall be conducted in accordance with 7.3.

6.4 Stability:

6.4.1 *Stability – Bassinet/cradle*—A product in all manufacturer's recommended use positions, including positions where the locks are engaged for preventing rocking/swinging motion of the sleeping surface, shall not tip over and shall retain the

FIG. 3 Opening Example

FIG. 4 Corner Post Extension

CAMI dummy when tested in accordance with 7.4.1. Compact bassinets/cribdlers are excluded from this requirement.

6.4.2 *Stability – Compact bassinet/cribdlers*—A product in all manufacturer’s recommended use positions shall not tip over and shall retain the CAMI dummy when tested in accordance with 7.4.2.

6.5 *Mattress:*

6.5.1 Each product shall be sold with the mattress included.

6.5.2 *Mattress Thickness for Fabric or Mesh Sided Products*—The filling material of the uncompressed mattress such as foam, fiberfill, etc. shall not exceed 1-in. (25-mm) in thickness. The total thickness of the uncompressed mattress including all fabric or vinyl layers, filling material, and any structural members such as wood, hardboard, etc., shall not exceed 1½ in. (38 mm).

6.5.3 *Mattress Dimensions*—The dimensions of the mattress supplied with the product shall be such that the mattress, when inserted in the center of the unit in a noncompressed state at any of the adjustable positions, shall not leave a gap of more

than ½ in. (13 mm) at any point between the perimeter of the mattress and the perimeter of the unit. When the mattress is placed against the perimeter of the unit, the resulting gap shall not exceed 1 in. (25 mm).

6.6 *Side Height*—The upper surface of the non-compressed mattress of the product, when the mattress support is in any position, must be at least 7.5 in. (191 mm) lower than the upper surface of the lowest side in all intended use positions as measured in accordance with 7.11.

6.7 *Protective Components*—If the occupant can grasp components between the thumb and forefinger or teeth (such as caps, sleeves, or plugs used for protection from sharp edges, points, or entrapment of fingers or toes), or if there is at least a 0.040-in. (1.00-mm) gap between the component and its adjacent parent component, such component shall not be removed when tested in accordance with 7.7.

6.8 *Bassinets with Segmented Mattresses: Flatness Test*—If the bassinet or bassinet accessory has a folding or segmented mattress, or both, any angle when measured in 7.8 less than or equal to 10° is an immediate pass. Any angle when measured in 7.8 greater than 10° is an immediate failure. Segmented bassinet mattresses that have seams (located between segments or where the mattress folds) that are less than 15 in. in length are excluded from this requirement.

6.8.1 *Rationale*—This test was created to address a suffocation hazard associated with “V” shapes formed in segmented mattresses seams and based on assessment of both newborn and infant anthropometric weights. The requirement was based on the 5th percentile newborn angle of 11°, on either side of a child’s nose, and subtracting 1° as a safety factor resulting in a maximum of 10°. The infant cylinder was selected for this test as it captured all failures encountered with a newborn cylinder but also captured failures undetected by the newborn cylinder. The infant test cylinder is a more stringent test given the allowable angle of a newborn is 10° maximum instead of the infant 14°.

6.9 *Fabric Sided Enclosed Openings*—For bassinets/cribels with fabric sides, a completely bounded opening shall not be created that allows the complete passage of the torso probe (Fig. 5) when tested in accordance with 7.9. This test does not apply to play yard bassinets as defined in 3.1.15 or bassinet/cribels accessories as defined in 3.1.2.

6.10 *Rock/Swing Angle*—Bassinets or cribels that incorporate a rock/swing feature shall meet the following:

6.10.1 The maximum deflection angle measurement on any reading shall not exceed 20° when tested in accordance with 7.10.

6.10.2 The arithmetic mean of the rest angle measurements shall not exceed 7° when calculated for each rock/swing direction independently, when tested in accordance with 7.10.

6.11 *Removable Bassinet Bed Attachment to Base/Stand*—Any product containing a removable bassinet bed with a latching or locking device intended to secure the removable bassinet bed to the base/stand shall comply with at least one of the following 6.11.1 – 6.11.5 when tested in accordance with 7.12.

NOTE 1—The probe dimensions represent the torso diameter of a 5th percentile 0 to 2-month-old infant.

FIG. 5 Torso Probe

6.11.1 The base/stand shall not support the removable bassinet bed (that is, the removable bassinet bed falls from the base/stand and contacts the floor or the base/stand collapses when the removable bassinet bed is not locked into the base/stand).

6.11.2 The lock/latch shall automatically engage under the weight of the removable bassinet bed (without any other force or action) in all lateral positions, as shown in Fig. 6.

6.11.3 The sleep surface of the removable bassinet bed shall be at an angle of at least 20° from a horizontal plane when the removable bassinet bed is in an unlocked position.

6.11.4 The removable bassinet bed or base stand, or both, shall provide a false latch/lock visual indicator(s) that are at a minimum visible from both of the long sides of the product. A

FIG. 6 Bassinet Bed Resting on Stand, Showing Possible Alternate Lateral Positions

visual indicator(s) shall be visible to a person standing at each of the long sides of the product but not necessarily visible from all other positions around the product.

6.11.5 The removable bassinet bed shall not tip over and shall retain the CAMI newborn dummy when tested in accordance with 7.12.5.3.

7. Test Methods

7.1 *Component Spacing*—For compliance with the spacing of components test requirement and procedures, the sections related to “Spacing of Unit Components” of the referenced Consumer Safety Specification F406 in 16 CFR 1220 shall be used.

7.2 *Permanency of Labels and Warnings:*

7.2.1 A paper label (excluding labels attached by a seam) shall be considered permanent if, during an attempt to remove it without the aid of tools or solvents, it cannot be removed, it tears upon removal, or such action damages the surface to which it is attached.

7.2.2 A non-paper label (excluding labels attached by a seam) shall be considered permanent if, during an attempt to remove it without the aid of tools or solvents, it cannot be removed or such action damages the surface to which it is attached.

7.2.3 A warning label attached by a seam shall be considered permanent if it does not detach when subjected to a 15-lbf (67-N) pull force applied in any direction most likely to cause failure using a clamp with a 3/4-in. (19-mm) diameter clamping surface. Apply the force evenly over 5 s and maintain for an additional 10 s.

7.2.4 *Adhesion Test for Warnings Applied Directly onto the Surface of the Product:*

7.2.4.1 Apply the tape test defined in Test Method B, Cross-Cut Tape Test of Test Methods D3359, eliminating the parallel cuts.

7.2.4.2 Perform this test once in each different location where warnings are applied.

7.2.4.3 The warning statements will be considered permanent if the printing in the area tested is still legible and attached after being subjected to this test.

7.2.5 A non-paper label, during an attempt to remove it without the aid of tools or solvents, shall not be removed or shall not fit entirely within the small parts cylinder defined in 16 CFR 1501 if it can be removed.

7.3 *Static Load:*

7.3.1 Assemble bassinet/cribble per manufacturer’s instructions.

7.3.2 Place a 6 by 6 by 3/8-in. (152 by 152 by 9.5-mm) nominal thickness aluminum block in the bassinet/cribble at the center of the mattress. Gradually apply a weight of 54 lb (24 kg) or 3 times the manufacturer’s recommended weight (whichever is greater) within 5 s on the block and maintain for 60 s.

7.3.3 Test the unit in all manufacturer’s recommended use positions that could affect the sleeping surface’s ability to withstand the test weight.

7.3.4 For play yards bassinet, repeat 7.3.2 and 7.3.3, except apply the 54 lb weight or 3 times the manufacturer’s recom-

mended weight (whichever is greater) at a corner of the bassinet portion in the play yard.

7.3.5 Repeat 7.3.4 at each of the other three corners.

7.3.5.1 *Rationale*—54 lb is 3 times the weight of the 95 percentile of a 3- to 5-month-old infant.

7.4 *Stability:*

7.4.1 *Stability – Bassinet/cribble*—Assemble bassinet/cribble in accordance with manufacturer’s instructions.

7.4.1.1 Position the unit on the floor and place against the angle stop.

7.4.1.2 Place the CAMI Newborn dummy on the mattress in the center of the product face up with the arms and legs straightened.

7.4.1.3 Apply a 23-lb (10.35-kg) static vertical load to the most onerous position along the upper side rail closer to the angle stop. Apply the static load over a 5 s period and maintain the static load during the application of the force specified in 7.4.1.4.

7.4.1.4 Gradually apply a horizontal force of 5 lb (22 N) within 5 s at the same location of the uppermost horizontal side rail where the vertical load is applied. The direction of the load is such that the unit is forced against the stop.

(1) *Rationale*—The dual application of the horizontal and vertical forces will simulate an angled load tipping the unit over. The 23-lb load is the mean strength of a male 2-year-old pulling.⁷

7.4.1.5 Maintain the application of the static vertical load and horizontal force for 10 s.

7.4.1.6 Test the unit in all manufacturer’s recommended use positions.

7.4.2 *Stability – Compact bassinet/cribble:*

7.4.2.1 Assemble product in accordance with manufacturer’s instructions.

7.4.2.2 Adjust a smooth inclined surface to 20° from horizontal. Inclined surface is fitted with a 1 in. by 1 in. (25.4 mm by 25.4 mm) stop or equivalent device mounted parallel to the lower edge of the inclined surface and parallel to the floor so as to prevent the product from sliding, but not prevent it from tipping.

7.4.2.3 Place the CAMI Infant Dummy, Mark II in the product face up and in the geometric center of the mattress support with both arms touching the torso and equidistant between both head and foot ends of the sleep surface. If the CAMI Infant Dummy, Mark II, cannot be positioned fully flat on the compact bassinet/cribble sleeping surface, use the CAMI Newborn Dummy (Fig. 2) fitted with a weighted vest where vest has 10 lb weight equally distributed between three pockets as shown in Fig. 7.

7.4.2.4 Place the product (with CAMI dummy) sideways on the inclined surface.

7.4.2.5 Slide CAMI dummy along the side-to-side centerline until one of its arms touches the inside wall of the product lowest side and adjust the CAMI dummy so that both arms touch the torso as shown in Fig. 8 and Fig. 9.

⁷ Brown, W. C., Buchanan, C. J., and Mandel, J., A Study of the Strength Capabilities of Children Ages Two Through Six, Report No. NBSIR 73-156, U.S. Department of Commerce, Bureau of Standards, Washington, D.C., 1973.

FIG. 7 Weighted Vest

FIG. 8 Feet-end of the Product with CAMI Dummy's Arm Touching the Inside Surface of the Product's Lower Side and Both Arms Touching the Torso

force of 10 lb (45 N) to the latching or locking mechanism in the direction tending to release it.

7.6 Mesh Opening Test:

7.6.1 Equipment—A steel rod of 0.250 in. (6.35 mm) in diameter with a 0.125-in. (3.18-mm) full radius tip.

7.6.2 Procedure—With the product in the fully erect position, gradually apply a force of 5 lb (22 N) perpendicular to the plane of the mesh opening using the rod specified above.

7.7 Removal of Protective Components:

7.7.1 Any protective component shall be tested in accordance with each of the following test methods in the sequence listed.

7.7.2 Secure the product so that it cannot move during the performance of the following test methods:

7.7.3 Torque Test—A torque of 2 lb-in. (0.23 N·m) shall be applied evenly within a period of 5 s in a clockwise direction until a rotation of 180° from the original position has been attained or 2 lb-in. (0.23 N·m) has been reached. The torque or maximum rotation shall be maintained for an additional 10 s. The torque shall be removed and the protective components permitted to return to a relaxed condition. The procedure shall be repeated in the counterclockwise direction.

7.7.4 Tension Test:

7.7.4.1 Attach a force gauge to the cap, sleeve, or plug by means of any suitable device. For protective components that cannot reasonably be expected to be grasped between thumb and forefinger or teeth on their outer diameter but have a gap of at least 0.040 in. (1.0 mm) between the rear surface of the component and the structural member of the bassinet/criadle to which it is attached, a clamp such as that shown in Fig. 11 may be a suitable device.

7.7.4.2 Be sure that the attachment device does not compress or expand the component hindering any possible removal.

7.7.4.3 Gradually apply 15 lbf (67 N) in the direction that would normally be associated with the removal of the protective component over a 5-s period and hold for an additional 10 s.

7.8 Segmented Mattress Flatness Test:

7.8.1 Angle Measurement for Bassinets Intended For a Single Occupant:

7.8.1.1 Establish a horizontal reference plane by placing an inclinometer, with an accuracy capable of 0.5° minimum resolution, on the floor of the testing area and zeroing it.

7.8.1.2 Assemble the product according to the manufacturer's instructions. If the product has more than one mode, assemble in the bassinet mode(s). Disable the rocking/swinging feature if the product is equipped with such a feature.

7.8.1.3 Place the infant test cylinder as shown in Fig. 12, on one side of the mattress in the center of the 1st seam (the seam between an end panel and its adjacent panel) as shown in Fig. 13 and allow the cylinder to come to rest in the seam.

(1) If the cylinder begins to roll out of the seam, place a stop(s) on the mattress surface against the cylinder to prevent movement. The stop(s) shall not influence the angle measurement and shall have a total weight no greater than 0.25 lb.

7.4.2.6 Repeat this test in the position most likely to fail in all manufacturer's recommended use positions on the inclined surface with CAMI dummy repositioned each time in accordance with 7.4.2.6(1) and 7.4.2.6(2).

NOTE 1—The position most likely to fail could be a product position between the true sideward, rearward, or forward positions, and product may include removable cover and other accessories per manufacturer's instructions.

(1) When the product is placed on the slope as shown in Fig. 10, reposition the CAMI dummy along the head-to-feet centerline until the crown of the dummy's head or feet touch the inside wall at lower end of the sleep surface.

(2) In all other product positions, reposition the CAMI dummy along the side-to-side centerline until one of its arms touches the inside surface of the product's lower side and adjust the CAMI dummy so that both arms touch the torso.

7.5 Unintentional Folding Test:

7.5.1 Products Designed Without Latching or Locking Devices:

7.5.1.1 Place the unit in the manufacturer's recommended use position.

7.5.1.2 Place a CAMI Infant Dummy, Mark II, in the center of the product face up with the arms and legs straightened.

7.5.1.3 Place a stop on the floor in a manner that would prevent the unit from sliding and tipping but will not prevent it from folding.

7.5.1.4 Position the unit against the stop in the orientation most likely to cause it to fold. Apply a 20-lbf (89-N) in direction most likely to fail to the top edge of the bassinet.

7.5.2 Products designed with a single-action release mechanism latching or locking devices—With the product in the manufacturer's recommended use position, gradually apply a

FIG. 9 Top View of Fig. 8 Test Set-up

FIG. 10 CAMI Dummy Position when Product Short Side Touches the Inclined Surface Stop

iTeh Standards (www.itoh.com) 15 lbf (67 N) MAX TENSION

7.8.1.4 Place a 6 by 4 by ½ in. (152 by 101.6 by 12.7 mm) nominal thickness steel block weighing 3.3 ± 0.2 lb on the mattress panel in front of the cylinder with the 6 in. length of the block in line with the center line of the cylinder as shown in Fig. 14. Place the block within ½ in. (12.7 mm) of the cylinder. If the block slides and touches the cylinder, this is allowable.

(1) Where the play yard bassinet size constraints do not allow for placement of the steel block in front of the cylinder, move the cylinder off center enough to allow placement of the block as outlined above in 7.8.1.4.

7.8.1.5 Place the inclinometer in the center of the block and measure the angle formed with the horizontal along the line that is perpendicular to the longitudinal axis of the cylinder as shown in Fig. 15. Ensure the inclinometer does not touch the mattress surface.

NOTE 2—If needed, an additional level block of negligible mass, no greater than 0.2 lb, may be placed atop the steel block in order to elevate the inclinometer such that it does not touch the mattress surface.

7.8.1.6 Record the angle measurement.

7.8.1.7 Repeat 7.8.1.4 and 7.8.1.5 on the opposite side of the seam and record the measurement.

7.8.1.8 Remove the cylinder from the bassinet.

7.8.1.9 Repeat 7.8.1.3 – 7.8.1.8 on each remaining seams of the mattress and record the angles.

7.8.2 Angle Measurement for Bassinets Intended For Two Occupants:

7.8.2.1 Establish a horizontal reference plane by placing an inclinometer, with an accuracy capable of 0.5° minimum resolution, on the floor of the testing area and zeroing it.

FIG. 13 Cylinder Placement on Mattress Seam

FIG. 16 Newborn Test Cylinder

FIG. 14 Steel Block in Front of Cylinder for Single Occupant Bassinet

FIG. 17 Placement of Cylinders for 2-Occupant Bassinet

in Fig. 18. Place the block within ½ in. (12.7 mm) of the cylinder. If the block slides and touches the cylinder, this is allowable.

7.8.2.2 Place one at a time, two identical newborn test cylinders (A and B) as shown in Fig. 16 in the occupant retention areas as shown in Fig. 17 and allow them to come to rest in the seam.

(1) If the cylinder begins to roll out of the seam place a stop(s) on the mattress surface against the cylinder to prevent movement. The stop(s) shall not influence the angle measurement and shall have a total weight no greater than 0.25 lb.

7.8.2.3 Apply a 10.0 ± 0.5 lb compression force simultaneously with a force gauge onto the center of each cylinder and hold for 10 s.

7.8.2.4 Place a 6 by 4 by ½ in. (152 by 101.6 by 12.7 mm) nominal thickness steel block weighing 3.3 ± 0.2 lb on the mattress panel in front of the cylinder with the 6 in. length of the block in line with the center line of the cylinder as shown

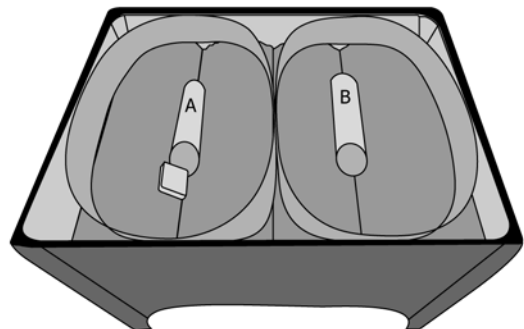

FIG. 18 Steel Block in Front of Cylinder for 2-Occupant Bassinet

FIG. 19 Inclinometer on Steel Block in front of Cylinder for 2-Occupant Bassinet

(1) Where the play yard bassinet size constraints do not allow for placement of the steel block in front of the cylinder, move the cylinder off center enough to allow placement of the block as outlined above in 7.8.2.4.

7.8.2.5 Place the inclinometer on the block and measure the angle formed with the horizontal along the line that is perpendicular to the longitudinal axis of cylinder A as shown in Fig. 19. Ensure that the inclinometer does not touch the mattress surface.

NOTE 3—If needed, an additional level block of negligible mass, no greater than 0.2 lb, may be placed atop the steel block in order to elevate the inclinometer such that it does not touch the mattress surface.

7.8.2.6 Record the angle measurement.

7.8.2.7 Repeat 7.8.2.4 and 7.8.2.5 on the opposite side of the cylinder and record the measurement.

7.8.2.8 Repeat the angle measurements 7.8.2.4 – 7.8.2.7 for cylinder B and record the measurement.

7.8.2.9 Remove both cylinders and then place them in the occupant retention areas such that the side of the cylinders are in contact with the inside wall as shown in Fig. 20.

7.8.2.10 Apply a 10.0 ± 0.5 lb compression force simultaneously with a force gauge onto the center of each cylinder and hold for 10 s.

7.8.2.11 Place 6 by 4 by ½ in. (152 by 101.6 by 12.7 mm) nominal thickness steel block weighing 3.3 ± 0.2 lb on the mattress panel on one side perpendicular to the longitudinal axis of the cylinder, with the centerline of the block adjacent to the midpoint of the cylinder as shown in Fig. 18. Place the

block within ½ in. (12.7 mm) of the cylinder. If the block slides and touches either the inside wall or the cylinder, this is allowable.

7.8.2.12 Place the inclinometer in the center of the block and measure the angle formed with the horizontal along the line that is perpendicular to the longitudinal axis of cylinder A as shown in Fig. 21.

7.8.2.13 Record the angle measurement.

7.8.2.14 Place a 6 by 4 by ½ in. (152 by 101.6 by 12.7 mm) nominal thickness steel block weighing 3.3 ± 0.2 lb on the mattress panel on one side perpendicular to the longitudinal axis of the cylinder, with the centerline of the block adjacent to the midpoint of the cylinder as shown in Fig. 18. Place the block within ½ in. (12.7 mm) of the cylinder. If the block slides and touches the cylinder, this is allowable.

7.8.2.15 Place the inclinometer in the center of the block and measure the angle formed with the horizontal along the line that is perpendicular to the longitudinal axis of cylinder B as shown in Fig. 22.

7.8.2.16 Record the angle measurement.

7.8.3 For bassinets that have mattress support rods/bars not permanently attached, remove the mattress support rods/bars and repeat 7.8.1.3 – 7.8.1.9 for single occupant bassinets and 7.8.2.2 – 7.8.2.16 for two occupant bassinets.

NOTE 4—Mattress support rods/bars that are permanently attached to the product do not fall under the testing requirement described in 7.8.3.

7.9 Fabric Release Test Methods for Enclosed Openings:

7.9.1 Assemble and place the bassinet/cradle in the manufacturer's recommended use position. If the bassinet has a non-rocking locking mechanism, place the bassinet in non-rocking mode.

7.9.2 With the torso test probe attached to a force gauge, place the small end of the probe against the fabric on the inside wall of the product and between any structural elements in any locations deemed most likely to fail without removing the mattress.

7.9.3 Apply a 20 lb (89 N) force to the probe over a period of 5 s and hold for an additional 10 s.

7.9.4 Upon completion of 7.9.3, without adjusting the fabric, evaluate any additional openings by repeating 7.9.2 and repeat 7.9.3 at these additional locations.

7.9.5 If the product has a removable cover, unfasten all fasteners or snaps, or both, but leave cover in place. Replace mattress in the product and repeat 7.9.2 – 7.9.4.

7.9.6 Repeat 7.9.1 – 7.9.5 in all manufacturer's recommended bassinet/cradle use positions.
