

Designation: D4171 – 22

Standard Specification for Fuel System Icing Inhibitors¹

This standard is issued under the fixed designation D4171; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope*

1.1 This specification covers additives for aviation fuels (for example, Specifications [D910](#), [D7547](#), and [D1655](#)) used to inhibit ice formation in aircraft fuel systems.

1.2 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.3 **WARNING**—Mercury has been designated by many regulatory agencies as a hazardous substance that can cause serious medical issues. Mercury, or its vapor, has been demonstrated to be hazardous to health and corrosive to materials. Use Caution when handling mercury and mercury-containing products. See the applicable product Safety Data Sheet (SDS) for additional information. The potential exists that selling mercury or mercury-containing products, or both, is prohibited by local or national law. Users must determine legality of sales in their location.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.5 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

3. Classification

3.1 Two types of fuel system icing inhibitors are provided as follows:

3.1.1 *Type II*—Anhydrous isopropanol, also described as 99 % grade 2-Propanol or isopropyl alcohol, is used as an anti-icing additive in aviation gasoline. (**Warning**—Isopropanol (2-Propanol) is both flammable and an irritant; use with caution.)

3.1.2 *Type III*—Diethylene glycol monomethyl ether (DiEGME) is used as an anti-icing additive in both aviation gasoline and aviation turbine fuel. (**Warning**—Diethylene glycol monomethyl ether, (DiEGME). Combustible, toxic material.)

3.1.2.1 Test Method [D5006](#) can be used to determine the concentration of DiEGME in aviation fuels.

NOTE 1—Ethylene glycol monomethyl ether (EGME) was previously included in this specification as Type I, last appearing in D4171 – 94. EGME is considered technically satisfactory for this application, but has been generally replaced by DiEGME due to availability, reduced toxicological concerns, and lack of widely available methodology to determine FSII concentration in aviation fuels when a mixture is known to be present, or when the identity of the FSII present in the fuel is not clearly known.

4. Properties

4.1 *Type II*—Isopropanol anti-icing additive shall conform to the requirements of [Table 1](#), as manufactured.

4.2 *Type III*—Diethylene glycol monomethyl ether shall conform to the requirements of [Table 2](#), as manufactured.

TABLE 1 Detailed Requirements for Isopropanol (99 % Grade) (Type II) FSII

| Property | Requirement | ASTM Test Method |
|------------------------------------|---|--|
| Acidity, max, mg KOH/g | 0.019 | D1613 |
| Relative density: | | |
| 20 °C/20 °C | 0.785 to 0.787 | D268 |
| 25 °C/25 °C | 0.782 to 0.784 | D268 |
| Color, platinum-cobalt, max | 10 | D1209 , D8005 , or D5386 |
| Distillation range, max, °C | 1.5 (including 82.3 °C) | D1078 |
| Nonvolatile matter, max, mg/100 mL | 5 | D1353 |
| Odor | characteristic, nonresidual | D1296 |
| Water, max, mass % | 0.2 | D1364 |
| Heptane miscibility at 20 °C | miscible without turbidity with 19 vol heptane (99 % Grade) | D1476 |
| Water miscibility at 25 °C | miscible without turbidity when diluted with 10 vol distilled water | D1722 |

TABLE 2 Detailed Requirements for Fuel System Icing Inhibitors (Type III)

| Property | Requirement | |
|---|-------------------|--|
| | DiEGME (Type III) | ASTM Test Method |
| Acid number, max, mg KOH/g | 0.09 | D1613 |
| Color, platinum-cobalt, max | 10 | D1209 , D8005 , or D5386 |
| Purity, min, mass % | 99.0 | Annex A1 |
| pH of 25 % solution in water (25 °C ± 2 °C) | 5.5–7.5 | E70 ^A |
| Relative density, 20 °C/20 °C | 1.020–1.025 | D891 (Method A or B) or D4052 |
| Water, max, mass % | | D1364 , E1064 , or E203 |
| Point of manufacture | 0.10 | |
| Point of use | 0.8 | |
| Flash point, min, °C | 85 °C | D93 , D56 , or D3828 |
| Antioxidant, mg/kg | 50–150 | ^B |

^A Pipette 25 mL of the inhibitor into a 100 mL volumetric flask and filled with freshly boiled and cooled distilled water having a pH of 6.5 to 7.5. Measure the pH value with a pH meter calibrated in accordance with Test Method [E70](#).

^B Acceptable antioxidants are: 2,6-ditertiary-butyl-4-methylphenol, 2,4-dimethyl-6-tertiary-butyl phenol, 2,6-ditertiary-butyl phenol, and 75 % min 2,6-ditertiary-butyl phenol plus 25 % max tertiary and tritertiary butyl phenols.

5. Sampling

5.1 The material shall be sampled in accordance with Practice [E300](#).

6. Test Methods

6.1 Determine the properties enumerated in this specification in accordance with the following ASTM methods:

6.1.1 *Relative Density*—Determine the relative density (that is, specific gravity) at 20 °C or 25 °C with respect to water by a method accurate to the third decimal place. See Section 5 of Test Method [D268](#), Test Method [D4052](#), or Method A or B of Test Methods [D891](#).

6.1.2 *Color*—Test Method [D1209](#), [D8005](#), or [D5386](#).

6.1.3 *Distillation Range*—Test Method [D1078](#) using ASTM Solvents Distillation Thermometers (40C with a range from 72 °C to 126 °C for isopropanol) conforming to the requirements of Specification [E1](#) or any other temperature measuring device that cover the temperature range of interest, such as thermocouples, thermistors, or resistance temperature detectors (RTDs). An instrument meeting Guide [E2877](#) or Specification [E2251](#) may be used in preference to 40C if the instrument provides equivalent or better accuracy and precision.

6.1.4 *Nonvolatile Matter*—Test Method [D1353](#).

6.1.5 *Odor*—Test Method [D1296](#).

6.1.6 *Water*—Test Method [D1364](#), [E1064](#), or [E203](#).

6.1.7 *Heptane Miscibility*—Test Method [D1476](#).

6.1.8 *Acidity*—Test Method [D1613](#).

6.1.9 *Water Miscibility*—Test Method [D1722](#).

6.1.10 *Flash Point*—Test Methods [D56](#), [D93](#), or [D3828](#).

7. Keywords

7.1 additives; aircraft fuel systems; aviation fuels; fuel system icing inhibitors; ice formation

(Mandatory Information)
A1. TEST METHOD FOR DETERMINING PURITY OF FUEL SYSTEM ICING INHIBITOR (TYPE III)
A1.1 Scope

A1.1.1 This test method measures the purity of fuel system icing inhibitors (Type III). The test results are used to determine if the inhibitor meets the purity requirements listed in [Table 2](#).

A1.2 Summary of Test Method

A1.2.1 A representative sample of fuel system icing inhibitor (Type III) is injected into a capillary gas chromatograph and the components of the inhibitor are separated and measured with a flame ionization detector. Quantitation is made by peak area measurement using external standardization and a computing integrator. As the linear dynamic range of many gas chromatographic detectors is often exceeded for the major component, the sum of all impurities (all components other than the inhibitor) are subtracted from 100 to calculate the purity of the icing inhibitor.

A1.3 Significance and Use

A1.3.1 Fuel system icing inhibitor performance (Type III) is based upon test results using the pure inhibitor in a specific concentration range. Impurities affect inhibitor solubility in the fuel and reduce the effective concentration. Methods are therefore needed to check additive purity to ensure adequate performance in the aircraft.

A1.4 Apparatus

A1.4.1 *Gas Chromatograph*—Any gas chromatographic instrumentation can be used that meets the requirements described below.

A1.4.2 *Temperature Control*—The chromatograph must be capable of programmed temperature operation.

A1.4.3 *Sample Inlet System*—An automatic sampler with split injection is recommended, however, manual split injection is acceptable if care is taken to assure injected sample volume and rate of injection is constant. On-column injection is acceptable, however, modifications to the procedure are required which are not specified here.

A1.4.4 *Detector*—A hydrogen flame ionization detector (HFID) is recommended, however, any detector can be used that has the sensitivity to measure the purity of the icing inhibitors at the levels listed in [Table 2](#).

A1.4.5 *Column*—Any gas chromatographic column can be used that provides separation of the impurities from the fuel system icing inhibitor (Type III). Columns and conditions that have been used successfully are shown in [Table A1.1](#).

A1.4.6 *Integrator*—Provide means for the determination of peak areas for the impurities and the icing inhibitors. This can be accomplished with a computer or electronic integrator.

A1.4.7 *Analytical Balance*—Capable of measuring 0.1 mg.

TABLE A1.1 Recommended Operating Conditions

| | |
|--------------------|---|
| Column | 30 M by 0.32 mm bonded phase 86 % methyl, 14 cyanopropyl '1701' (1.0 μm film thickness) fused-silica capillary column |
| Column temperature | 100 °C initial temperature, programmed to 250 °C at 12 °C/min |
| Injection system | Split injection system which contains a glass insert liner that is firmly packed with silylated glass wool. The split ratio is 50:1 and the injection temperature is 250 °C |
| Detector | Hydrogen flame ionization at 250 °C |
| Sample volume | 0.5 μL with a 5 μL syringe |
| Carrier gas | Helium at an average flow velocity of 20 cm/second (propane elutes in 2.5 min with a column temperature of 60 °C) to give a flow rate of ~1 mL/min |
| Make-up gas | Helium at 20 mL/min |
| Air flow | 350 mL/min |
| Hydrogen flow | 30 mL/min |

A1.5 Reagents

A1.5.1 *Purity of Reagents*—Use reagent grade chemicals in all tests. Unless otherwise indicated, it is intended that all reagents conform to the specifications of the Committee on Analytical Reagents of the American Chemical Society where such specifications are available.⁴ Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lessening the accuracy of the determination.

A1.5.2 *Air*—Use air (hydrocarbon free) as the HFID oxidant. (**Warning**—Air is usually supplied as a compressed gas under high pressure and supports combustion.)

A1.5.3 *Hydrogen*—Use hydrogen (hydrocarbon free) as the fuel for the flame ionization detector. (**Warning**—Extremely flammable. Hydrogen is usually supplied as a compressed gas under high pressure.)

A1.5.4 *Helium*—Use helium (hydrocarbon free) as the carrier gas for the chromatograph. (**Warning**—Helium is usually supplied as a compressed gas under high pressure.)

A1.5.5 *Ethylene Glycol*—Use ethylene glycol (anhydrous, 99 + %) as a calibration standard for analysis of diethylene glycol monomethyl ether. (**Warning**—Toxic, irritant.)

A1.5.6 *Ethylene Glycol Monomethyl Ether*—Use EGME (anhydrous, 99 + %) as a calibration standard for analysis of diethylene glycol monomethyl ether. (**Warning**—See [Note 1](#).) (**Warning**—Ethylene glycol monomethyl ether (EGME).
