

Designation: B232/B232M – 22

Standard Specification for Concentric-Lay-Stranded Aluminum Conductors, Coated-Steel Reinforced (ACSR)¹

This standard is issued under the fixed designation B232/B232M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers concentric-lay-stranded conductors made from round aluminum 1350-H19 (extra hard) wires and round, coated steel core wire(s) for use as overhead electrical conductors (Explanatory [Note 1](#) and Explanatory [Note 2](#)).

1.2 ACSR covered by this specification has nine types of coated steel core wire which are designated by abbreviations as follows (Explanatory [Note 2](#)):

1.2.1 *ACSR/GA* or *ACSR/GA2*—ACSR using Class A zinc-coated steel wire,

1.2.2 *ACSR/GC* or *ACSR/GC2*—ACSR using Class C zinc-coated steel wire,

1.2.3 *ACSR/MA* or *ACSR/MA2*—ACSR using Class A Zn-5A1-MM coated steel wire,

1.2.4 *ACSR/HS* or *ACSR/GA3*—ACSR using Class A zinc-coated high-strength steel wires,

1.2.5 *ACSR/MS* or *ACSR/MA3*—ACSR using Class A Zn-5A1-MM coated high-strength steel wires,

1.2.6 *ACSR/GA4*—ACSR using Class A zinc-coated extra-high-strength steel wires,

1.2.7 *ACSR/MA4*—ACSR using Class A Zn-5A1-MM coated extra-high-strength steel wires,

1.2.8 *ACSR/GA5*—ACSR using Class A zinc-coated ultra-high-strength steel wires,

1.2.9 *ACSR/MA5*—ACSR using Class A Zn-5A1-MM coated ultra-high-strength steel wires.

1.3 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the*

¹ This specification is under the jurisdiction of ASTM Committee B01 on Electrical Conductors and is the direct responsibility of Subcommittee B01.07 on Conductors of Light Metals.

Current edition approved Dec. 1, 2022. Published January 2023. Originally approved in 1948. Last previous edition approved in 2017 as B232/B232M – 17. DOI: 10.1520/B0232_B0232M-22.

responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.

1.5 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

3. Terminology

3.1 *Definitions:*

3.1.1 *galvanized*—zinc coated.

3.2 *Abbreviations:*

3.2.1 *Zn-5Al-MM*—zinc-5 % aluminum-mischmetal alloy.

3.2.2 *ACSR*—aluminum conductor, steel reinforced.

3.2.3 *ACSR/GA* or *ACSR/GA2*—reinforced with galvanized steel core wire, coating Class A in accordance with Specification **B498/B498M**.

3.2.4 *ACSR/GC* or *ACSR/GC2*—reinforced with galvanized steel core wire, coating Class C in accordance with Specification **B498/B498M**.

3.2.5 *ACSR/HS* or *ACSR/GA3*—reinforced with high-strength galvanized steel core wire in accordance with Specification **B606/B606M**.

3.2.6 *ACSR/MA* or *ACSR/MA2*—reinforced with Zn-5Al-MM coated steel core wire, coating Class A in accordance with Specification **B802/B802M**.

3.2.7 *ACSR/MS* or *ACSR/MA3*—reinforced with high-strength Zn-5Al-MM coated steel core wire in accordance with Specification **B803/B803M**.

3.2.8 *ACSR/MA4*—reinforced with extra-high-strength Zn-5Al-MM coated steel core wire in accordance with Specification **B958/B958M**.

3.2.9 *ACSR/GA4*—reinforced with extra-high-strength galvanized steel core wire in accordance with Specification **B957/B957M**.

3.2.10 *ACSR/MA5*—reinforced with ultra-high-strength Zn-5Al-MM coated steel core wire in accordance with Specification **B958/B958M**.

3.2.11 *ACSR/GA5*—reinforced with ultra-high-strength galvanized steel core wire in accordance with Specification **B957/B957M**.

4. Classification

4.1 For the purpose of this specification conductors are classified as follows (Explanatory **Notes 1 and 2**):

4.1.1 *Class AA*—For bare conductors usually used in overhead lines. These conductors are divided into two types as follows:

4.1.1.1 Conductors used for regular over-head line construction, and

4.1.1.2 Conductors having a high ratio of mechanical strength to current-carrying capacity used for overhead ground wires and for extra-long span construction. These are denoted under the Class column in **Table 1** and **Table 2** as “(HS)” for High Strength.

4.1.2 *Class A*—For conductors to be covered with weather-resistant materials.

5. Ordering Information

5.1 Orders for material under this specification shall include the following information:

5.1.1 Quantity of each size, stranding, and class,

5.1.2 Conductor size, circular-mil area or AWG (Section 9 and **Table 1**),

5.1.3 Number of wires, aluminum and steel (see **Tables 1-5**),

5.1.4 Type of steel core wire and type and area density (if applicable) of coating (see **6.2**),

5.1.5 Direction of lay of outer layer of aluminum wires if other than right-hand (see **8.3**),

5.1.6 Special tension test, if desired (see **15.3**),

5.1.7 Place of inspection (Section 16),

5.1.8 Package size and type (see **17.1**),

5.1.9 Heavy wood lagging, if required (see **17.3**), and

5.1.10 Special package marking, if required (see **17.4**).

6. Requirement for Wires

6.1 Before stranding, the aluminum wire used shall meet the requirements of Specification **B230/B230M**.

6.2 Before stranding, the steel core wire used shall meet the requirements of Specification **B498/B498M**, **B606/B606M**, **B802/B802M**, **B803/B803M**, **B957/B957M**, or **B958/B958M**, whichever is applicable.

7. Joints

7.1 Electric-butt welds, cold-pressure welds, and electric-butt, cold-upset welds in the finished individual aluminum wires composing the conductor may be made during the stranding process. No weld shall occur within 50 ft [15 m] of a weld in the same wire or in any other wire of the completed conductor (Explanatory **Note 3**).

7.2 There shall be no joints of any kind made in the finished zinc-coated or zinc-5% aluminum-mischmetal alloy coated steel wires.

Conversion factors:
1 cmil = 5.067 E – 4 mm²
1 in. = 25.4 mm
1 lb/1000ft = 1.4882 kg/km
1 ft = 0.3048 m
1 kip = 1000 lbf = 4.448 kN

8. Lay

8.1 The length of lay of the various layers of aluminum wires in a conductor shall conform to Table 5 (see Explanatory Note 4).

8.2 The length of lay of the various layers of steel wire shall conform to the requirements of B500/B500M.

8.3 The direction of lay of the outside layer of aluminum wires shall be right hand unless otherwise specified in the purchaser order. The direction of lay of the aluminum and steel wires shall be reversed in successive layers.

8.4 In a conductor having multiple layers of aluminum wires, the length of lay of any aluminum layer shall not be less than the length of lay of the aluminum layer immediately beneath it.

9. Construction

9.1 ACSR may be constructed using steel core wire with any one of two types of protective coatings. The acceptable core wires are:

9.1.1 Galvanized steel core wires, with coating Classes A or C in accordance with Specification B498/B498M;

9.1.2 High-strength galvanized steel core wire, coating Class A in accordance with Specification B606/B606M;

9.1.3 Zn-5Al-MM coated steel core wire, coating Class A, in accordance with Specification B802/B802M;

9.1.4 High-strength Zn-5Al-MM coated steel core wire, coating Class A in accordance with Specification B803/B803M;

9.1.5 Extra-high-strength galvanized steel core wire coating Class A in accordance with Specification B957/B957M;

9.1.6 Extra-high-strength Zn-5Al-MM coated steel core wire, coating Class A in accordance with Specification B958/B958M;

9.1.7 Ultra-high-strength galvanized steel core wire coating Class A in accordance with Specification B957/B957M; or

9.1.8 Ultra-high-strength Zn-5Al-MM coated steel core wire, coating Class A in accordance with Specification B958/B958M.

9.2 The number and diameter of aluminum and steel wires and the area of cross section of aluminum wires shall conform to the requirements prescribed in Tables 1-5.

9.3 Where compressed stranding is required in order to insulate the conductor properly, one or more aluminum layers of any stranded conductor consisting of 7 wires or more may be slightly compressed. The nominal diameter of the compressed conductor is 3 % below the nominal diameter of noncompressed conductor and the area of cross section after compressing is in accordance with Section 13.

9.4 For “HS” (High Strength) type conductors as denoted in Table 1 and Table 2, unless specified by the customer, the default strength of steel shall be regular strength Type GA2 to Specification B498/B498M or MA2 to Specification B802/B802M.

9.5 All steel wires shall lie naturally in their position in the stranded core, and where the core is cut, the wire ends shall remain in position or be readily replaced by hand and then remain approximately in position. This requirement also applies to the outer layer of aluminum wires of a conductor.

9.6 The stranded steel core shall be free from waviness and kinks.

9.7 Before stranding, aluminum and steel wires shall have approximately uniform temperatures.

9.8 The diameter of the finished conductor shall be not less than 99 % nor more than 101 % of that shown in Table 1 and

Table 2 when measured with a diameter tape between the closing die(s) and the capstan of the strand.

10. Rated Strength of Conductor

10.1 The rated strength of a completed conductor shall be taken as the aggregate strength of the aluminum and steel components, calculated as follows. The strength contribution of the aluminum wires shall be taken as the percentage, indicated in **Table 6**, of the sum of the strengths of the 1350-H19 wires, calculated from their specified nominal wire diameter and the appropriate specified minimum average tensile strength given in Specification **B230/B230M**. The strength contribution of the steel core wires shall be taken as the percentage, according to the number of layers of steel wires, indicated in **Table 6**, of the sum of the strengths of the steel wires, calculated from their specified nominal wire diameter and the appropriate specified minimum stress at 1 % extension given in Specification **B498/B498M**, **B606/B606M**, **B802/B802M**, or **B803/B803M**, whichever is applicable.

10.2 Rated strength and breaking strength values shall be rounded to three significant figures, in the final value only, in accordance with the rounding method of Practice **E29**.

10.3 Rated strength of various constructions are given in **Table 3** or **Table 4**.

11. Density

11.1 For the purpose of calculating mass per unit length, cross sections, etc., the density of aluminum 1350 shall be taken from Specification **B230/B230M**.

11.2 For the purpose of calculating mass per unit length, cross sections, etc., the density of galvanized or Zn-5A1-MM coated steel wire shall be taken from the applicable ASTM wire specification: **B498/B498M**, **B606/B606M**, **B802/B802M**, **B803/B803M**, **B957/B957M**, or **B958/B958M**.

12. Mass Per Unit Length and Electrical Resistance

12.1 The mass per unit length and electrical resistance of a unit length of stranded conductor are a function of the length of lay. The approximate mass and electrical resistance may be determined using the standard increments shown in **Table 6**. When greater accuracy is desired, the increment based on the specific lay of the conductor may be calculated (Explanatory **Note 5**).

12.2 In the calculation of the electrical resistance of a conductor, the zinc-coated or Zn-5A1-MM coated steel core wires may be included.

13. Variation in Area

13.1 The area of cross section of the aluminum wires of a conductor shall be not less than 98 % of the area specified. Unless otherwise specified by the purchaser, the manufacturer may have the option of determining the cross-sectional area by either of the following methods, except that in case of question regarding area compliance, the method of **13.1.2** shall be used:

13.1.1 The area of cross section may be determined by calculations from diameter measurements, expressed to four decimal places, of the component aluminum wires at any point when measured perpendicularly to their axes.
