

Designation: A473 - 23 A473 - 23a

# Standard Specification for Stainless Steel Forgings<sup>1</sup>

This standard is issued under the fixed designation A473; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\varepsilon$ ) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the U.S. Department of Defense.

# 1. Scope\*

- 1.1 This specification covers austenitic, austenitic-ferritic, ferritic, and martensitic stainless steel forgings for general use, and for low- or high-temperature service.
- 1.2 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.
- 1.3 Supplementary requirements from Specification A788/A788M may be specified when additional testing, inspection, or processing is required.
- 1.4 This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.

## 3. Ordering Information

3.1 It is the responsibility of the purchaser to specify all requirements that are necessary for material ordered under this specification. Such requirements may include, but are not limited to, the following:

<sup>&</sup>lt;sup>1</sup> This specification is under the jurisdiction of ASTM Committee A01 on Steel, Stainless Steel and Related Alloys and is the direct responsibility of Subcommittee A01.06 on Steel Forgings and Billets.

Current edition approved March 1, 2023Sept. 1, 2023. Published April 2023September 2023. Originally approved in 1962. Last previous edition approved in 20212023 as A473A473 – 23.-21. DOI: 10.1520/A0473-23.10.1520/A0473-23A.

<sup>&</sup>lt;sup>2</sup> For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For *Annual Book of ASTM Standards* volume information, refer to the standard's Document Summary page on the ASTM website.

<sup>&</sup>lt;sup>3</sup> Available from SAE International (SAE), 400 Commonwealth Dr., Warrendale, PA 15096, http://www.sae.org.

3.1.1 Quantity (weight or number of pieces);
3.1.2 Dimensions, including prints or sketches;
3.1.3 Name of material (stainless steel forgings);
3.1.4 Type or UNS designation (Table 1);
3.1.5 Condition (Table 2);-and
3.1.6 ASTM designation and date of issue;
3.1.7 Test for magnetic permeability, if specified by customer purchase order when ordering Types 207 and 205; and
3.1.8 Special requirements.
3.2 If possible, the intended end use of the item should be given on the purchase order, especially when the item is ordered for a specific end use or uses.
Note 1—A typical ordering description is as follows: 5 stainless steel forgings, Type 410, Designation A, ASTM Specification A473 dated End use: pump blocks for oil well equipment.
4. General Requirements
4.1 Material supplied to this specification shall conform to the requirements of Specification A788/A788M, which outlines additional ordering information, manufacturing requirements, testing and retesting methods and procedures, marking, certification, product analysis variations, and additional supplementary requirements.
4.2 If the requirements of this specification are in conflict with the requirements of Specification A788/A788M, the requirements of this specification shall prevail.
5. Manufacture ASTM A473-23a
5.1 Material for forgings shall consist of ingots or blooms, billets, slabs, or bars, either forged or rolled from an ingot, and cut to the required length by a suitable process.

A Maximum, unless range or minimum is indicated.								· ·				

<sup>&</sup>lt;sup>A</sup> Maximum, unless range or minimum is indicated.

<sup>B</sup> New designation established in accordance with Practice E527 and SAE J1086.

<sup>C</sup> At manufacturer's option; reported only when intentionally added.

<sup>D</sup> Columbium (Cb) and Niobium (Nb) are alternate names for element 41 in the Periodic Table of the Elements.

<sup>E</sup> % Cr + 3.3 × % Mo + 16 × % N ≥ 40.

<sup>F</sup> Wrought version of CA6NM.

<sup>&</sup>lt;sup>A</sup> Yield strength shall be determined by the 0.2 % offset method in accordance with Test Methods and Definitions A370. An alternative method of determining yield strength may be used based on a total extension under load of 0.5 %.

5.2 The material shall be forged by hammering, pressing, rolling, extruding, or upsetting. It shall be brought as nearly as possible to the finished shape and size by <a href="hot-working">hot-working</a> and shall be processed, if practicable, so as to cause metal-flow during the hot-working operation in the direction most favorable for resisting the stresses encountered in service as may be indicated to the manufacturer by the purchaser.

<sup>&</sup>lt;sup>B</sup> Type 431 forgings of designation *A*, when specified, shall be capable of meeting the above mechanical property requirements of designation *T* after oil quenching from 1800 °F to 1900 °F (980 °C to 1038 °C) and tempering at not less than 1100 °F (595 °C), or designation *H* when oil quenched from 1850 °F to 1950 °F (1010 °C to 1065 °C) and tempered at not more than 700 °F (370 °C).

- 5.3 When specified on the order, a sample forging may be sectioned and etched to show flow lines and the condition as regards internal imperfections. When so specified, the question of acceptable and unacceptable metal-flow shall be subject to agreement between the manufacturer and the purchaser prior to order entry.
- 5.4 When specified on the order, the manufacturer shall submit for approval of the purchaser a sketch showing the shape of the rough forging before machining, or before heat treating for mechanical properties.
- 5.5 The grain size shall be as fine as practicable and precautions shall be taken to minimize grain growth.

## 6. Heat Treatment

- 6.1 Except for S31254, the austenitic steels shall receive a solution heat treatment, consisting of heating the material to a minimum temperature of 1900 °F (1040 °C), followed by water quenching or rapid cooling by other means sufficient to prevent the formation of grain boundary carbides. Alternatively, immediately following hot working, while the temperature of the forging is not less than 1900 °F (1040 °C), forgings made from austenitic grades (except Types 310, 321, 347, and 348) may be individually rapidly quenched to less than 500 °F (260 °C).
- 6.2 S31254 shall receive a solution heat treatment, consisting of heating the material to a minimum temperature of 2100 °F (1150 °C) followed by water quenching or rapid cooling by other means sufficient to prevent the formation of grain boundary carbides.
- 6.3 When specified, Types 347, 348, and 321 shall receive a stabilization heat treatment in addition to the solution heat treatment specified in 6.1, which shall consist of holding the forgings at 1550 °F to 1750 °F (845 °C to 955 °C) for at least 1 h for each inch of section thickness with a minimum holding time of 2 h, followed by air-cooling or water quenching. The stabilization heat treatment is not usually specified, unless these steels are intended for severely corrosive environments in the temperature range from 800 °F to 1600 °F (425 °C to 870 °C). When specified, the stabilization heat treatment shall be the final heat treatment and may be performed before machining.
- 6.4 S32950 shall receive an annealing treatment, consisting of heating the material to a temperature of 1825 °F (995 °C) to 1875 °F (1025 °C) for an appropriate time followed by water quenching or rapid cooling by other means:
- 6.4 \$32760 shall receive an annealing treatment consisting of Alternatively, Ferritic-Austenitic grades shall be cooled below 1000 °F (538 °C), then be subjected to the solution annealing treatment shown in Table 3heating the material. Ferritic-Austenitic grades may be solution annealed without cooling below 1000 °F (538 °C) by re-heating to the solution annealing temperature required in Table 3to a minimum temperature of 2010 °F (1100 °C), followed by water quenching or rapid cooling by other means:, held for a time sufficient to dissolve phases and precipitates which may cause a reduction in corrosion or mechanical properties, and liquid quenched in accordance with Table 3.
- 6.5 The ferritic grades shall be properly annealed: annealed.
- 6.6 Except for S41425 and S41500, the martensitic grades shall be annealed, or hardened and tempered as specified. Liquid quenching shall be permitted only by agreement with the purchaser.
- 6.7 For S41425, heat to 1700 °F (925 °C) minimum and hold for 1 h at temperature minimum. Air cool to below 90 °F (32 °C) and temper at 1100 °F (595 °C) minimum for 1 h/in. of cross-sectional thickness minimum.

**TABLE 3 Solution Anneal Method** 

<u>Grade</u>	Solution Annealing Temp °F (°C)	Quench	Quenching Cool
		Media	Below °F (°C)
S32550	1920-2060 (1050-1125)	Liquid	500 (260)
S32760	2010 min (1100 min)	Liquid	500 (260)
S32950	1825-1875 (995-1020)	Water	500 (260)
