

Designation: ~~D3235 – 16~~^{ε1} D3235 – 23

Standard Test Method for Solvent Extractables in Petroleum Waxes¹

This standard is issued under the fixed designation D3235; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

^{ε1} NOTE—Corrected misplaced figures editorially in December 2016.

1. Scope*

1.1 This test method covers the determination of solvent extractables in petroleum waxes.

1.2 The values stated in SI units are to be regarded as standard.

1.2.1 *Exception*—The values given in parentheses are for information only.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.4 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

[E128 Test Method for Maximum Pore Diameter and Permeability of Rigid Porous Filters for Laboratory Use](#)

3. Terminology

3.1 *Definitions:*

3.1.1 For definitions of terms used in this test method, refer to Terminology [D4175](#).

4. Summary of Test Method

4.1 The sample is dissolved in a mixture consisting of 50 % by volume methyl ethyl ketone and 50 % by volume toluene. The solution is cooled to $-32\text{ }^{\circ}\text{C}$ ($-25\text{ }^{\circ}\text{F}$) to precipitate the wax, then filtered. The solvent extractables content is determined by evaporating the solvent from the filtrate and determining the mass of the residue.

¹ This test method is under the jurisdiction of ASTM Committee D02 on Petroleum Products, Liquid Fuels, and Lubricants and is the direct responsibility of Subcommittee D02.10 on Properties of Petroleum Waxes and Alternative Wax-like Materials.

Current edition approved July 1, 2016Oct. 1, 2023. Published July 2016October 2023. Originally approved in 1973. Last previous edition approved in 20152016 as ~~D3235 – 15~~D3235 – 16^{ε1}. DOI: 40.1520/D3235-16E01-10.1520/D3235-23.

*A Summary of Changes section appears at the end of this standard

5. Significance and Use

5.1 The solvent extractables in a wax may have significant effects on several of its properties such as strength, hardness, flexibility, scuff resistance, coefficient of friction, coefficient of expansion, melting point, and staining characteristics. Whether these effects are desirable or undesirable depends on the intended use of the wax.

6. Apparatus

6.1 *Filter Stick and Assembly*, consisting of a 10 mm diameter sintered glass filter stick of 10 µm to 15 µm maximum pore diameter as determined by the method in [Appendix X1](#), provided with an air pressure inlet tube and delivery nozzle. It is provided with a ground-glass joint to fit a 25 mm by 170 mm test tube. The dimensions for a suitable filtration assembly are shown in [Fig. 1](#).

NOTE 1—A metallic filter stick may be employed if desired. A filter stick³ made of stainless steel and having a 12.7 mm (0.50 in.) disk of 10 nm to 15 nm maximum pore diameter, as determined by Test Method [E128](#), has been found to be satisfactory. The metallic apparatus is inserted into a 25 mm by 150 mm test tube and held in place by means of a cork.

6.2 *Cooling Bath*, consisting of an insulated box with 30 mm ± 5 mm (1.2 in. ± 0.2 in.) holes in the center to accommodate any desired number of test tubes. The bath may be filled with a suitable medium such as kerosine, and may be cooled by circulating a refrigerant through coils, or by using solid carbon dioxide. A suitable cooling bath to accommodate three test tubes is shown in [Fig. 2](#).

6.3 *Dropper Pipet*, dispensing device capable of delivering 0.5 g ± 0.05 g of molten wax.

6.4 *Transfer Pipet*, or equivalent volume dispensing device, capable of delivering 15 mL ± 0.06 mL.

All dimensions are in millimetres.

FIG. 1 Filter Stick

³ The sole source of supply of a suitable metal filter stick with designated porosity G known to the committee at this time is the Pall Trinity Micro Corp., Route 281, Cortland, NY 13045. A list of United Kingdom suppliers can be obtained from Energy Institute, 61 New Cavendish St., London, W1G 7AR, United Kingdom. If you are aware of alternative suppliers, please provide this information to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee,¹ which you may attend.

All dimensions are in millimetres (inches).

FIG. 2 Cooling Bath

6.5 *Air Pressure Regulator*, designed to supply air to the filtration assembly (8-59.5) at sufficient pressure to give an even flow of filtrate. Either a conventional pressure-reducing valve or a mercury bubbler-type regulator has been found satisfactory. The latter type, illustrated in Fig. 3, consists of a 250 mL glass cylinder and a T-tube held in the cylinder by means of a rubber stopper grooved at the sides to permit the escape of excess air. The volume and pressure of the air supplied to the filtration assembly is regulated by the depth to which the T-tube is immersed in mercury at the bottom of the cylinder. Absorbent cotton placed in the space above the mercury prevents the loss of mercury by spattering. The air pressure regulator is connected to the filter stick and assembly by means of rubber tubing.

6.6 *Temperature Measuring Devices:*

6.6.1 *Thermometers*, two, having a range as shown below and conforming to the requirements as prescribed in Specification E1 or in the specifications for IP Standard Thermometers. One thermometer is required for the cold bath and a second thermometer is required for the sample solution.

Temperature Range	ASTM	Thermometer Number	IP
-37 °C to +21 °C	71C		72C
-35 °F to +70 °F	71F		72F

All dimensions are in millimetres.

FIG. 3 Air Pressure Regulator

6.6.2 Temperature measuring devices other than those described in 5.6.16.6.1 are satisfactory for this test method, provided they exhibit the same temperature response as the equivalent mercury-in-glass thermometers.

6.7 Weighing Bottles, glass-stoppered, having a typical capacity of 15 mL to 25 mL.

6.8 Evaporation Assembly, consisting of an evaporating cabinet and connections, essentially as illustrated in Fig. 4, and capable of maintaining a temperature of $35\text{ }^{\circ}\text{C} \pm 1\text{ }^{\circ}\text{C}$ ($95\text{ }^{\circ}\text{F} \pm 2\text{ }^{\circ}\text{F}$) around the evaporation flasks. Construct the jets with an inside diameter of $4\text{ mm} \pm 0.2\text{ mm}$ for delivering a stream of clean, dry air vertically downward into the weighing bottle. Support each jet so that the tip is $15\text{ mm} \pm 5\text{ mm}$ above the surface of the liquid at the start of the evaporation. Supply purified air at the rate of 2 L/min to 3 L/min per jet. One way to purify the air is to pass it through a tube of approximately 1 cm bore packed loosely to a height of approximately 20 cm with absorbent cotton. Periodically check the cleanliness of the air by evaporating 4 mL of the solvent mixture described in 6.37.3 by the procedure specified in 8.59.5. When the residue does not exceed 0.1 mg, the evaporation equipment is operating satisfactorily.

NOTE 2—Investigations by the European World Federation have indicated that improved precision may be achieved by individually calibrating each nozzle to deliver a flow rate of 2 L/min to 3 L/min.

6.9 Analytical Balance, capable of reproducing masses to 0.1 mg.

6.10 Wire Stirrer—A piece of stiff made of iron, stainless steel, or Nichrome wire of about No. 20 Bands (0.9 mm in diameter) or 16 swg. gage, 250 mm long. A 10 mm diameter loop is formed at each end, and the loop at the bottom end is bent so that the plane of the loop is perpendicular to the wire.

7. Solvent

7.1 Methyl Ethyl Ketone, conforming to the specifications of the Committee on Analytical Reagents of the American Chemical Society.⁴

7.2 Toluene, conforming to the specifications of the Committee on Analytical Reagents of the American Chemical Society.⁴

⁴ Reagent Chemicals, American Chemical Society Specifications, ACS Reagent Chemicals, Specifications and Procedures for Reagents and Standard-Grade Reference Materials, American Chemical Society, Washington, DC.
