About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

- Catalogue of IEC publications: www.iec.ch/searchpub

The IEC on-line Catalogue enables you to search by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, withdrawn and replaced publications.

- IEC Just Published: www.iec.ch/online_news/justpub

Stay up to date on all new IEC publications. Just Published details twice a month all new publications released. Available on-line and also by email.

- Electropedia: www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing more than 20 000 terms and definitions in English and French, with equivalent terms in additional languages. Also known as the International Electrotechnical Vocabulary online.

- Customer Service Centre: www.iec.ch/webstore/custserv

If you wish to give us your feedback on this publication or need further assistance, please visit the Customer Service Centre FAQ or contact us:

A propos de la CEI

La Commission Electrotechnique Internationale (CEI) est la première organisation mondiale qui élabore et publie des normes internationales pour tout ce qui a trait à l'électricité, à l'électronique et aux technologies apparentées.

A propos des publications CEI

Le contenu technique des publications de la CEI est constamment revu. Veuillez vous assurer que vous possédez l'édition la plus récente, un corrigendum ou amendement peut avoir été publié.

- Catalogue des publications de la CEI: www.iec.ch/searchpub/cur_fut-f.htm

Le Catalogue en-ligne de la CEI vous permet d'effectuer des recherches en utilisant différents critères (numéro de référence, texte, comité d'études,...). Il donne aussi des informations sur les projets et les publications retirées ou remplacées.

- Just Published CEI: www.iec.ch/online_news/justpub

Restez informé sur les nouvelles publications de la CEI. Just Published détaille deux fois par mois les nouvelles publications parues. Disponible en-ligne et aussi par email.

- Electropedia: www.electropedia.org

Le premier dictionnaire en ligne au monde de termes électroniques et électriques. Il contient plus de 20 000 termes et définitions en anglais et en français, ainsi que les termes équivalents dans les langues additionnelles. Egalement appelé Vocabulaire Electrotechnique International en ligne.

- Service Clients: www.iec.ch/webstore/custserv/custserv_entry-f.htm

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**RADIATION PROTECTION INSTRUMENTATION –
EQUIPMENT FOR SAMPLING AND MONITORING
RADIOACTIVE NOBLE GASES**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with an IEC Publication.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62302 has been prepared by subcommittee 45B: Radiation protection instrumentation, of IEC technical committee 45: Nuclear instrumentation.

This standard directly complements IEC 60761-1 (2002) and IEC 60761-3 (2002).

The text of this standard is based on the following documents:

FDIS	Report on voting
45B/550/FDIS	45B/556/RVD

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this publication will remain unchanged until the maintenance result date indicated on the IEC web site under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

iTeh STANDARD PREVIEW (standards.iteh.ai)

[IEC 62302:2007](#)

<https://standards.iteh.ai/catalog/standards/sist/e5efa794-05e9-4a04-aea6-ae040745787f/iec-62302-2007>

RADIATION PROTECTION INSTRUMENTATION – EQUIPMENT FOR SAMPLING AND MONITORING RADIOACTIVE NOBLE GASES

1 Scope and object

This International Standard is applicable to equipment used for sampling and continuous measurement of radioactive noble gases in the workplace, in gaseous effluents discharged into the environment as well as in the environment itself. Monitoring by definition is the process of continuous and real-time measurement. The processes of sampling or taking samples for retrospective laboratory analysis are included in this standard.

The object of this standard is to establish mandatory general requirements and to present examples of acceptable methods and equipment for sampling and monitoring radioactive noble gases. Current standard IEC 60761-3 which is complemented by this standard, is applicable to installing portable and transportable equipment for sampling and monitoring radioactive noble gases, ONLY IN GASEOUS EFFLUENTS, while this standard expands coverage to include monitoring all possible locations where radioactive noble gases could present a radiological hazard. The equipment is designed to be operational during normal operation conditions as well as under emergency conditions, both during and following an accident. Depending on the nature of the emergency conditions it may be necessary to install specially designed equipment for normal operational conditions and other equipment for emergency conditions.

This standard is applicable to radioactive noble gas samplers and monitors intended to provide the following functions:

- The measurement of the volumetric activity of radioactive noble gases and their variation with time in the workplace, in gaseous effluents at the discharge point and in the environment.
- The measurements performed during normal operational conditions as well as under emergency conditions during and after an accidental release.
- The actuation of an alarm when a predetermined volumetric activity, or concentration, or a predetermined total of released radioactivity is exceeded.
- The determination of the total gaseous activity discharged over a given time and/or to provide information on the composition of a mixture of different gases released.
- The sampling and retrospective analysis of air or gas containing noble gas.

Radon, with isotopes ^{219}Rn , ^{220}Rn , and ^{222}Rn , is a naturally occurring radioactive noble gas whose measurements are NOT considered in this standard. The presence of radon and its progeny may significantly interfere with the proper measurement of the noble gases of concern in this standard.

This standard specifies the general characteristics, general testing procedures, mechanical, electrical and electronic, radiological, safety and environmental characteristics, and the proper identification and certification of the equipment. If this equipment is part of a centralized system for continuous radiation monitoring in a nuclear facility, there may be additional requirements from other standards related to those systems.

2 Normative references

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

acceptance test

contractual test to prove to the customer that the system meets certain conditions of its specification

iTeh STANDARD PREVIEW
(standards.iteh.ai)

3.2

accident conditions

conditions deviating from normal operations, more severe than anticipated operational occurrences, including design basis accidents and severe accidents

<https://standards.iteh.ai/catalog/standards/sist/e5efa794-05e9-4a04-aca6-11c0b937113c-02302-2007>

3.3

alarm assembly

assembly or a combination of assemblies whose output provides audible or visual alarm in the event that an alarm threshold has been exceeded or a malfunction has been detected

3.4

anticipated operation occurrence

operational process deviating from normal operation which is expected to occur at least once during the operational lifetime of a nuclear power plant but which, in view of appropriate design provisions, does not cause any significant damage to items important to safety or lead to accident conditions

3.5

coefficient of variation

the ratio V of the standard deviation s to the arithmetic mean \bar{x} of a set of n measurements x_i given by the following formula:

$$V = \frac{s}{\bar{x}} = \frac{1}{\bar{x}} \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

3.6

collection efficiency

where applicable, the collection efficiency of a monitor is defined as the ratio of the total activity available for measurement on or in the collection medium to the total activity in the air at the inlet of the collection medium

3.7**control assembly**

assembly used to process the output of the detection assembly and to provide data indication and electrical power for the entire system

3.8**conventionally true activity**

the best estimate of the activity of a radioactive source

NOTE Conventional activities, in general, are regarded as sufficiently close to the true values for the difference to be insignificant for the given purpose. For example, a value and its uncertainty determined from a primary or a secondary standard, or by a reference instrument which has been calibrated against a primary or secondary standard, may be taken as the conventionally true value.

3.9**coverage factor**

numerical factor (k) used as a multiplier of the combined standard uncertainty in order to obtain an expanded uncertainty (ISO GUM: 1995)

3.10**decision quantity**

random variable used to determine whether a physical effect to be measured is present or not

3.11**decision threshold**

fixed value of the radioactivity that allows a decision to be made for each measurement with a given probability of error as to whether the registered measurement includes a contribution from the physical effect

NOTE The statistical test shall be designed such that the probability of wrongly rejecting the hypothesis is equal to a designation α . For this standard error of the first type, α is equal to 5 %.

3.12**design basis accident**

accident conditions for which a nuclear power plant is designed according to established design criteria, and for which the damage of the fuel and the release of radioactive material are kept within authorized limits

3.13**detection limit**

minimum value of the measurement quantifying a physical effect that can be detected with a given probability of error by the measuring method.

NOTE The detection limit is the smallest true value of the measured value that is associated with the statistical test and hypotheses (Cf. decision quantity) by the following characteristics: if in reality the true value is equal to or exceeds the detection limit, the probability of wrongly not rejecting the hypothesis (error of the second kind) shall be at most equal to a given value β . For this standard β equals 5 %.

3.14**dynamic range**

ratio of the signal from the maximum measurable indication to the signal from the minimum detectable value of that quantity

3.15**effective range of measurement**

range of values of the radioactive quantity to be measured over which the performance of equipment or an assembly meets the requirements of its specifications

**3.16
error of indication**

difference between the indicated value v of an activity and the conventionally true value v_c of that activity at the point of measurement

$$\Delta v = v - v_c$$

where:

v is the value of the activity indicated by the equipment or assembly under test;

v_c is the conventionally true value of the activity.

**3.17
installed equipment**

equipment designed to be in place for many years. IEC 60050-393 specifies the “installed life” of such equipment as less than 40 years

**3.18
maintenance test**

test carried out periodically on a device or equipment to ascertain and, if necessary, make certain adjustments to ensure that its performance remains within specified limits

**3.19
manufacturer and purchaser**

the term "manufacturer" includes the designer and the seller of the equipment;

the term "purchaser" includes the user of the equipment.

[IEC 62302:2007](https://standards.iteh.ai/catalog/standards/sist/e5efa794-05e9-4a04-aca6-ae040745787f/iec-62302-2007)

**3.20
measurement assembly**

this assembly includes functional units designed to measure quantities related to ionizing radiation (activity, volumetric activity, etc.)

**3.21
measurement uncertainty**

parameter associated with the result of a measurement that characterizes the dispersion of the values that could reasonably be attributed to the measurement. Any result of measurement shall be given with the associated uncertainty calculated following method recommended in the ISO GUM: 1995

**3.22
monitor air circuit efficiency**

the air circuit efficiency of the monitor describes the losses of activity on the walls of the monitor between the air circuit inlet and the collection medium. It is defined as the ratio of the total activity available for the monitor to sample to the total activity in the air supplied at the inlet of the monitor.

**3.23
monitor sampling efficiency**

monitor sampling efficiency is defined as the ratio of the volumetric activity as available for measurement on or in the collection medium, to the volumetric activity in the air supplied to the inlet of the monitor. It is the product of the collection efficiency times the air circuit efficiency of the monitor.

**3.24
noble gas**

the radioactive noble gases of concern in this standard include ⁴¹Ar, ⁸⁵Kr, ¹³³Xe and ¹³⁵Xe in the workplace, in gaseous effluents and in the environment itself. The isotopes of Radon are NOT included.

**3.25
normal operation conditions**

operation within specified limits and conditions

**3.26
portable equipment**

equipment designed to be easily carried by one person to a location where a measurement is required or desired

**3.27
radiation detection assembly**

assembly or combination of assemblies capable of providing radiation measurements

**3.28
reference response**

the reference response R_{ref} is the ratio under standard test conditions, between the response indication of the monitor and the unit reference activity (Table 1). This response is expressed by the relation:

$$R_{ref} = \frac{V}{V_c}$$

iTeh STANDARD PREVIEW
(standards.iteh.ai)

IEC 62302:2007

where: <https://standards.iteh.ai/catalog/standards/sist/e5efa794-05e9-4a04-aca6-ae040745787f/iec-62302-2007>

v is the value of the activity measured by the equipment or assembly under test;

v_c is the conventionally true value of the activity.

**3.29
relative intrinsic error**

relative error of indication (e_i) of a piece of equipment or an assembly with respect to a quantity when subjected to a specified reference quantity under specified reference conditions expressed as:

$$e_i = \frac{v - v_c}{v_c}$$

**3.30
response time**

time required after a step variation in the measured quantity for the output signal variation to reach a given percentage for the first time, usually 90 %, of its final value

NOTE In this standard, 90 % is used.

**3.31
retention capacity**

the maximum quantity of a defined substance that can be retained at equilibrium in the medium considered

3.32**routine test**

a test to which each individual device is subjected during or after manufacture to ascertain whether it complies with certain criteria

3.33**sampling assembly**

a set of connected devices used to collect a representative gas or air sample

3.34**severe accident**

accident conditions more severe than a design basis accident involving significant core degradation

3.35**surface emission rate of a solid source**

number of particles of a given type above a given energy that are emerging from the front face of a source per unit time

NOTE This normally applies to alpha and beta emitting sources and not to photon sources, characterized by activity (refer to 7.2.1).

3.36**transportable equipment**

equipment designed to be in place for a limited time and capable of being transported to other locations for measurements

3.37**type test**

a test of one or more devices made to a certain design to show that the design meets certain specifications

3.38**sensitivity**

ratio of the variation of the observed variable to the corresponding variation of the measured quantity, for a given value of the measured quantity

3.39**volumetric activity**

radioactivity per unit volume of measured air or gas

4 Classification of noble gas monitoring equipment

There are a number of designs for noble gas monitors available with some monitors of special design to meet the specific needs of the user. This standard classifies noble gas monitors based on the following radiological requirements:

- Gamma detection (best applied to monitoring for ^{41}Ar)
- Beta detection
- Combination beta/gamma detection
- Radionuclide-specific (again applied to monitoring for ^{41}Ar)
- Measurement range
 - Low range monitors include those monitors that have range (R) $0 < R < 10 \text{ MBq/m}^3$.
 - High range monitors have a range $X < R < Y$ where “X” and “Y” are, respectively, the minimum and the maximum responses of the monitor as stated by the manufacturer.
- Working condition
