Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 5751-2 was prepared by Technical Committee ISO/TC 31, *Tyres, rims and valves*, Subcommittee SC 10, *Cycle, moped, motorcycle tyres and rims*.

<https://standards.iteh.ai/catalog/standards/sist/182217c3-ad86-44ec-b4a9-2841c39c7647/iso-5751-2-1994>

This third edition cancels and replaces the second edition (ISO 5751-2:1988), of which it constitutes a technical revision.

ISO 5751 consists of the following parts, under the general title *Motorcycle tyres and rims (metric series)*:

- Part 1: *Design guides*
- Part 2: *Tyre dimensions and load-carrying capacities*
- Part 3: *Range of approved rim contours*

Annex A of this part of ISO 5751 is for information only.

Motorcycle tyres and rims (metric series) —

Part 2:

Tyre dimensions and load-carrying capacities

1 Scope

This part of ISO 5751 specifies the designation, dimensions and load-carrying capacities of metric series 100, 90, 80, 70, 60, 55 and 50 motorcycle tyres to be mounted on the metric series of rims.

It applies to motorcycle tyres with reduced height/width ratio (low profile — 100, 90, 80, 70, 60, 55 and 50).

NOTE 1 ISO 4249 deals with the requirements for motorcycle tyres and rims (code-designated series) for rim diameters code 13 and above. ISO 6054 deals with the requirements for motorcycle tyres and rims (code-designated series) for rim diameters code 12 and below.

2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this part of ISO 5751. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this part of ISO 5751 are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 4223-1:1989, *Definitions of some terms used in the tyre industry — Part 1: Pneumatic tyres.*

ISO 5751-1:1994, *Motorcycle tyres and rims (metric series) — Part 1: Design guides.*

3 Definitions

For the purposes of this part of ISO 5751, the definitions given in ISO 4223-1 apply.

4 Tyre designation

In the tyre designation, the tyre size designation shall be as shown in table 1. The designation shall be completed by the addition of the "service description", i.e. load index and speed symbol [see 4.2 b)].

4.1 Tyre construction code

The tyre construction code shall be as follows:

- "-" for diagonal ply tyres;
- "R" for radial ply tyres.

4.2 Example

A motorcycle tyre having

- a) a size and construction of:
 - nominal section width 100 mm,
 - nominal aspect ratio 90,
 - diagonal construction,
 - nominal rim diameter code 18;

b) service description of:

- load-carrying capacity 224 kg,
- reference speed 150 km/h;

shall be marked

100/90 - 18 56 P

The load-carrying capacity and maximum speed codes are given in ISO 5751-1:1994, tables 3 and 4 respectively.

4.3 Motorcycle tyre indication

For nominal rim diameter codes 13 up to 19 inclusive, it is recommended to add the suffix "M/C" to the size and construction marking.

5 Tyre dimensions

Tables 1 to 10 show:

- a) the tyre designation as indicated in clause 4;
- b) the measuring rim width code;
- c) the design tyre dimensions, i.e. section width and overall diameter;
- d) the maximum tyre dimensions in service, i.e. overall width and overall diameter, for the various types of "tread configurations" to be considered by vehicle manufacturers in designing for tyre clearances.

6 Method of measurement of tyre dimensions

Before measuring, the tyre shall be mounted on the measuring rim ready for tyre fitment and inflated:

a) **for standard load tyres:**

- 225 kPa for speed symbols P and lower,
- 250 kPa for speed symbol S,
- 280 kPa for speed symbols higher than S;

b) **for extra load tyres:**

- 280 kPa for speed symbols M and P;

and allowed to stand for 24 h at normal room temperature, after which the inflation pressure shall be readjusted to the values shown above.

7 Tread configurations

Figure 1 in ISO 5751-1:1994 shows various tread configurations.

NOTE 2 These attributions of tread type configurations to the service are to be considered as examples only. The choice of a given tread type configuration for a given tyre depends on the tyre manufacturer alone.

Tread type A corresponds to highway service tyres manufactured in speed symbols P, S and higher.

Tread type B corresponds to highway service tyres (for high performance vehicles) manufactured in speed symbols S and higher.

Tread type C corresponds to tyres for on-and-off-road service manufactured in speed symbols up to H inclusive.

Tread type D corresponds to tyres for exclusive off-road service manufactured in speed symbol M.

8 Maximum load ratings

Tables 11 and 12 show the maximum tyre load ratings for 100 series tyres.

Tables 13 and 14 show the maximum tyre load ratings for 90 series tyres.

Tables 15 and 16 show the maximum tyre load ratings for 80 series tyres.

Table 17 shows the maximum tyre load ratings for 70 series tyres.

Table 18 shows the maximum tyre load ratings for 60 series tyres.

Table 19 shows the maximum tyre load ratings for 55 series tyres.

Table 20 shows the maximum tyre load ratings for 50 series tyres.

9 Inflation pressures

The inflation pressures are given as a guide only. The inflation pressures used in practice are subject to agreement between the tyre and vehicle manufacturers and should take into account not only the load, but also the tyre construction, road-holding, maximum speed, the location of the tyre, the operating conditions and the mechanical characteristics of the vehicle.

The maximum load-carrying capacity is referred to the following inflation pressures:

- a) rim diameter codes up to 12 inclusive:
 - normal load version: 250 kPa,
 - light load version: 175 kPa,
 - extra load version: 300 kPa;
- b) rim diameter codes 13 and above:
 - 1) normal load version:
 - tyres marked with speed symbols up to and including P: 225 kPa,
 - tyres marked with speed symbols Q, R, S: 250 kPa,

— tyres marked with speed symbols T, U, H: 280 kPa,

— tyres marked with speed symbol V: 290 kPa,

- 2) extra load version tyres with speed symbols up to and including P: 280 kPa.

10 Load capacity at reduced speeds

Subject to acceptance by the tyre manufacturer and taking into account the conditions of use of the motorcycle, the load capacities corresponding to the load indices indicated in tables 11 to 20 may be modified according to the percentage shown in table 21. This modification is possible when the motorcycle maximum speed is different from the one which is associated with the speed symbol.

1) In the case of radial construction, the tyre size designation is completed by the letter "R" in place of the dash "-" (e.g. 80/100 R 14 M/C).

2) For nominal rim diameter codes 13 up to 19 inclusive, it is recommended to add the suffix "M/C" to the tyre size designation.

3) Maximum overall diameters for tread types A and B are related to service up to 150 km/h.

1) In the case of radial construction, the tyre size designation is completed by the letter "R" in place of the dash "-" (e.g. 80/100 R 14 M/C).

2) For nominal rim diameter codes 13 up to 19 inclusive, it is recommended to add the suffix "M/C" to the tyre size designation.

3) Maximum overall diameters for tread types A and B are related to service up to 150 km/h.

Table 6 — 80 series tyre dimensions — Design and in-service — Nominal rim diameter codes 8, 10 and 12

Dimensions in millimetres

Tyre size designation ¹⁾	Measuring rim width code R_m	Design tyre		In-service ²⁾	
		Section width S	Overall diameter D_o	Maximum overall width W_{max}	Maximum overall diameter $D_{o,max}$
