About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

IEC Catalogue - webstore.iec.ch/catalogue

The stand-alone application for consulting the entire bibliographical information on IEC International Standards, Technical Specifications, Technical Reports and other documents. Available for PC, Mac OS, Android Tablets and iPad.

IEC publications search - www.iec.ch/searchpub

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and also once a month by email.

Electropedia - www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing more than 30 000 terms and definitions in English and French, with equivalent terms in 14 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

More than 55 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

A propos de l'IEC

La Commission Electrotechnique Internationale (IEC) est la première organisation mondiale qui élabore et publie des Normes internationales pour tout ce qui a trait à l'électricité, à l'électronique et aux technologies apparentées.

A propos des publications IEC

Le contenu technique des publications IEC est constamment revu. Veuillez vous assurer que vous possédez l'édition la plus récente, un corrigendum ou amendement peut avoir été publié.

Catalogue IEC - webstore.iec.ch/catalogue

Application autonome pour consulter tous les renseignements bibliographiques sur les Normes internationales, Spécifications techniques, Rapports techniques et autres documents de l'IEC. Disponible pour PC, Mac OS, tablettes Android et iPad.

Recherche de publications IEC - www.iec.ch/searchpub

La recherche avancée permet de trouver des publications IEC en utilisant différents critères (numéro de référence, texte, comité d'études,...). Elle donne aussi des informations sur les projets et les publications remplacées ou retirées.

IEC Just Published - webstore.iec.ch/justpublished

Restez informé sur les nouvelles publications IEC. Just Published détaille les nouvelles publications parues. Disponible en ligne et aussi une fois par mois par email.

Electropedia - www.electropedia.org

Le premier dictionnaire en ligne de termes électroniques et électriques. Il contient plus de 30 000 termes et définitions en anglais et en français, ainsi que les termes équivalents dans 14 langues additionnelles. Egalement appelé Vocabulaire Electrotechnique International (IEV) en ligne.

Glossaire IEC - std.iec.ch/glossary

Plus de 55 000 entrées terminologiques électrotechniques, en anglais et en français, extraites des articles Termes et Définitions des publications IEC parues depuis 2002. Plus certaines entrées antérieures extraites des publications des CE 37, 77, 86 et CISPR de l'IEC.

Service Clients - webstore.iec.ch/csc

INTERNATIONAL ELECTROTECHNICAL COMMISSION

WAVEGUIDE TYPE DIELECTRIC RESONATORS –

**Part 1-4: General information and test conditions –
Measurement method of complex relative permittivity for
dielectric resonator materials at millimetre-wave frequency**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with an IEC Publication.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 61338-1-4 has been prepared by IEC Technical committee 49: Piezoelectric and dielectric devices for frequency control and selection.

This bilingual version (2014-02) corresponds to the monolingual English version, published in 2005-11.

The text of this standard is based on the following documents:

FDIS	Report on voting
49/748/FDIS	49/751/RVD

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

The French version of this standard has not been voted upon.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

IEC 61338 consists of the following parts, under the general title *Waveguide type dielectric resonators*:

- Part 1: Generic specification
- Part 1-3: General information and test conditions – Measurement method of complex relative permittivity for dielectric resonator materials at microwave frequency
- Part 1-4: General information and test conditions – Measurement method of complex relative permittivity for dielectric resonator materials at millimetre-wave frequency
- Part 2: Guidelines for oscillator and filter applications
- Part 4: Sectional specification
- Part 4-1: Blank detail specification

The committee has decided that the contents of this publication will remain unchanged until the maintenance result date indicated on the IEC web site under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

WAVEGUIDE TYPE DIELECTRIC RESONATORS –

Part 1-4: General information and test conditions – Measurement method of complex relative permittivity for dielectric resonator materials at millimetre-wave frequency

1 Scope and object

This part of IEC 61338 describes the measurement method of dielectric properties for dielectric resonator materials at millimetre-wave frequency.

This standard consists of two measurement methods: a) the dielectric rod resonator method excited by NRD-guide (Non-Radiative Dielectric waveguide) and b) the cut-off waveguide method excited by coaxial cables with small loops.

- a) The dielectric rod resonator method excited by NRD-guide is similar to the dielectric rod resonator method given in IEC 61338-1-3. This method has the following characteristics:
- a complete and exact mathematical solution of complex permittivity is given by computer software;
 - the measurement error is less than 0,3 % for ϵ' and less than $0,05 \times 10^{-4}$ for $\tan \delta$;
 - the applicable measuring ranges of complex permittivity for this method are as follows:
frequency: $30 \text{ GHz} < f < 100 \text{ GHz}$;
 - relative permittivity: $2 < \epsilon' < 30$;
 - loss factor: $10^{-6} < \tan \delta < 10^{-2}$.
- b) The cut-off waveguide method excited by coaxial cables with small loops uses a dielectric plate sample placed in a circular cylinder of the TE_{011} mode. This method has the following characteristics:
- fringe effect is corrected using the correction charts on the basis of rigorous analysis;
 - the measurement error is less than 0,5 % for ϵ' and less than $0,05 \times 10^{-4}$ for $\tan \delta$;
 - the TCF is measured with high accuracy;
 - the applicable measuring ranges of dielectric properties for this method are as follows:
frequency: $30 \text{ GHz} < f < 100 \text{ GHz}$;
 - relative permittivity: $2 < \epsilon' < 30$;
 - loss factor: $10^{-6} < \tan \delta < 10^{-2}$.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 61338-1-3, *Waveguide type dielectric resonators – Part 1-3: General information and test conditions – Measurement method of complex relative permittivity for dielectric resonator materials at microwave frequency*

3 Measurement parameter

The measuring parameters are defined as follows:

$$\dot{\varepsilon}_r = \varepsilon' - j\varepsilon'' = D / (\varepsilon_0 E) \quad (1)$$

$$\tan \delta = \varepsilon'' / \varepsilon' \quad (2)$$

$$TC\varepsilon = \frac{1}{\varepsilon_{\text{ref}}} \frac{\varepsilon_T - \varepsilon_{\text{ref}}}{T - T_{\text{ref}}} \times 10^6 \quad (1 \times 10^{-6}/\text{K}) \quad (3)$$

$$TCF = \frac{1}{f_{\text{ref}}} \frac{f_T - f_{\text{ref}}}{T - T_{\text{ref}}} \times 10^6 \quad (1 \times 10^{-6}/\text{K}) \quad (4)$$

where

D is the electric flux density;

E is the electric field strength;

ε_0 is the permittivity in a vacuum;

$\dot{\varepsilon}_r$ is the complex relative permittivity;

ε' and ε'' are the real and imaginary components of the complex relative permittivity $\dot{\varepsilon}_r$;

$TC\varepsilon$ is the temperature coefficient of relative permittivity, and TCF being the temperature coefficient of resonance frequency;

ε_T and ε_{ref} are the real parts of the complex relative permittivity at temperature T and reference temperature T_{ref} ($T_{\text{ref}} = 20^\circ\text{C}$ to 25°C), respectively;

f_T and f_{ref} are the resonance frequency at temperature T and T_{ref} , respectively.

The TCF is related to $TC\varepsilon$ by the following equation:

$$TCF = -\frac{1}{2}TC\varepsilon - \alpha \quad (5)$$

where α is the coefficient of thermal expansion of the dielectric specimen.

It should be noted that this equation is satisfied when the 100 % of electro-magnetic energy in the measuring resonance mode is concentrated inside the dielectric specimen. In the actual case, TCF deviates by several $10^{-6}/\text{K}$ from the calculated value, because some portion of electro-magnetic energy is stored outside the dielectric specimen.

4 Dielectric rod resonator method excited by NRD-guide

4.1 Measurement equipment and apparatus

The measurement equipment and apparatus are as follows:

a) Measurement equipment

Figure 1 shows a schematic diagram of the equipment required for millimetre wave measurement. For the measurement of dielectric properties, only the information on the amplitude of transmitted power is needed, that is, the information on the phase of the transmitted power is not required. A scalar network analyzer can be used for the measurement, but a vector network analyzer has an advantage in precision of the measurement data.

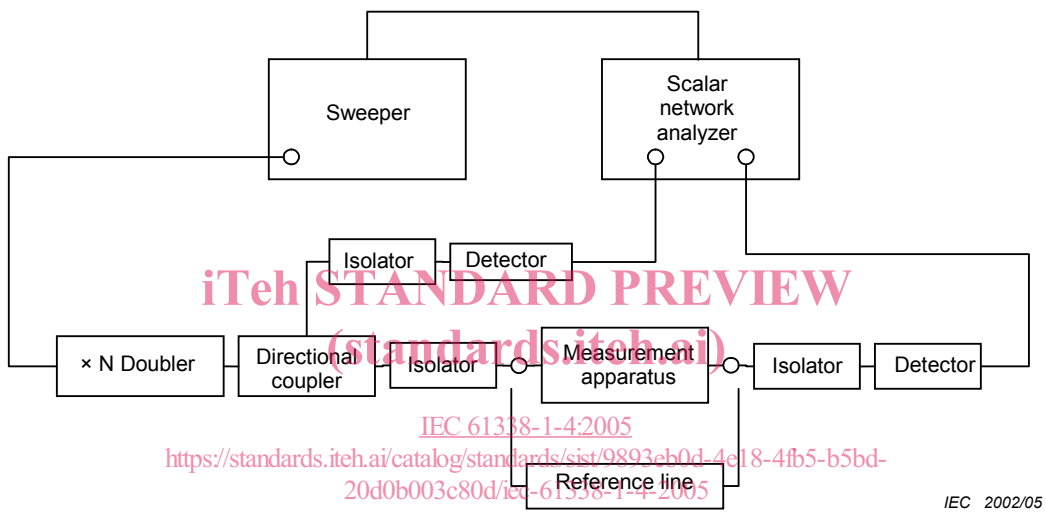

Figure 1a – Scalar network analyzer

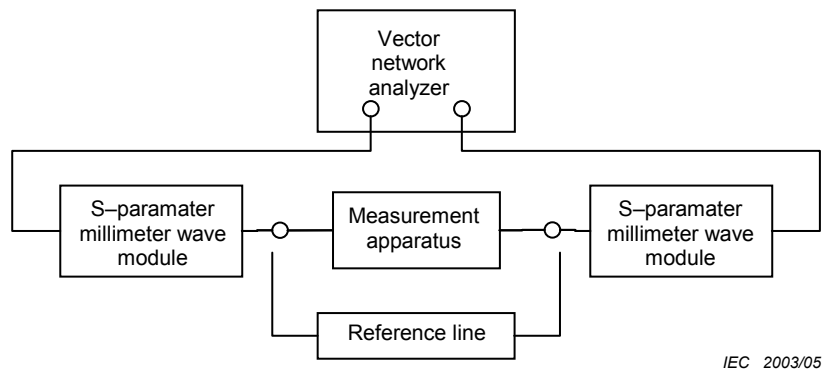

Figure 1b – Vector network analyzer

Figure 1 – Schematic diagram of measurement equipment

b) Measurement apparatus

Figure 2a shows a configuration of measuring apparatus of dielectric rod resonator method excited by NRD-guide. Figure 2b shows a cross-sectional view of the apparatus for measuring ϵ' and $\tan \delta$ of a dielectric specimen with height h and d . The dielectric specimen is placed at the centre of the apparatus between two parallel conducting plates, and coupled to input and output NRD-guides. There remains a small air gap Δh between the dielectric specimen and the upper conducting plate. For $\Delta h < 50 \mu\text{m}$, the air gap can be neglected for the calculation of ϵ' (see Annex A).

Figure 2a – Configuration of apparatus

Dimensions in millimetres

Figure 2b – Apparatus for ϵ' and $\tan \delta$ measurement

Figure 2c – Apparatus for TCF and $TC\epsilon$ measurement

Figure 2 – Measurement apparatus of dielectric rod resonator method excited by NRD-guide

Figure 2c shows an apparatus for measuring the temperature coefficient of resonance frequency TCF or that of relative permittivity $TC\varepsilon$. For this measurement, the upper conducting plate should be contacted to the dielectric specimen. The height of dielectric strip for NRD-guide is designed to be smaller than height h of the dielectric specimen. The upper conducting plate is set gently to touch the top face of the specimen, so that an excessive pressure does not damage the surface of conducting plate.

As shown in Table 1, a diameter of the conducting plates in Figure 2b is determined by the diameter of dielectric specimen. In this measurement method, the ε' and $\tan \delta$ are calculated under the condition that the conducting plates have an infinitely large diameter. As actual conducting plates have a finite diameter, a part of electro-magnetic energy leaks outward the conducting plates. Although this leaky energy shifts the resonance frequency and decreases the unloaded Q , its contribution is negligibly small under the condition of $d'/d > 5$.

Table 2 shows the example of dimensions for dielectric strips of NRD-guide in Figure 2b. Dielectric strips of the NRD-guide are made of PTFE or cross-linked styrene copolymer.

Figure 3 shows a waveguide transducer that connects the measuring apparatus to the measurement equipment with WR-15 or WR-10 waveguides. Table 3 shows the dimensions of the waveguide transducers. As shown in Figure 2b, the end of the dielectric strip of the NRD-guide is sharpened in the transducer.

Table 1 – Diameter of conducting plate

Diameter d'	$d' = 5d \sim 10d$ d : diameter of dielectric specimen
Material of conducting plate	Copper or silver is recommended

Table 2 – Dimension of dielectric strip of NRD-guide

Material	Measurement frequency range GHz	Height h_s mm	Width w_s mm
PTFE ($\varepsilon' = 2,0$)	55 to 65	2,25	2,50
	75 to 80	1,80	1,90
Cross-linked styrene Copolymer ($\varepsilon' = 2,5$)	55 to 65	2,25	2,00
	75 to 80	1,80	1,60

Table 3 – Dimensions of waveguide transducer

Waveguide	Frequency range GHz	h_{wg} mm	w_{wg} mm	h_s mm
WR-15	55 to 65	3,80	1,90	2,25
WR-10	75 to 80	2,54	1,27	1,80

Figure 3 – Waveguide transducer from NRD-guide to waveguide

4.2 Theory and calculation equations

4.2.1 Measurement of relative permittivity and loss factor

Figure 4 shows a configuration of the TE_{0m1} mode resonator. The cylindrical dielectric specimen is short-circuited at both ends by the two parallel conducting plates. The values ϵ' and $\tan \delta$ of the dielectric resonator are calculated from the resonance frequency f_0 and unloaded quality factor Q_u measured for the TE_{0m1} resonance mode. It is recommended to use the TE_{011} , TE_{021} and TE_{031} resonance modes for the materials with $\epsilon' = 2$ to 4, 4 to 20 and 20 to 30, respectively.

The resonance wavelength λ_0 in free space and the guiding wavelength λ_g in the dielectric transmission line are given by the following equations:

$$\lambda_0 = \frac{c}{f_0}, \quad \lambda_g = 2h \quad (6)$$

where c is the velocity of light in a vacuum ($c = 2,997\,9 \times 10^8$ m/s).

As described in 4.1b), the air gap Δh can be neglected for the calculation of ϵ' and $\tan \delta$ in the case of $\Delta h < 50\ \mu\text{m}$. So, the height h is used in equation (6).

Figure 4 – Configuration of a cylindrical dielectric rod resonator short-circuited at both ends by two parallel conducting plates

The value v^2 is calculated from λ_0 and λ_g :

$$v^2 = \left(\frac{\pi d}{\lambda_0} \right)^2 \left[\left(\frac{\lambda_0}{\lambda_g} \right)^2 - 1 \right] \tag{7}$$

Using the value v^2 , the value u^2 is calculated: <https://standards.iteh.ai/catalog/standards/sist/9893eb0d-4e18-4fb5-b5bd-20d0b003c80d/iec-61338-1-4-2005>

$$u \frac{J_0(u)}{J_1(u)} = -v \frac{K_0(v)}{K_1(v)} \tag{8}$$

where $J_n(u)$ is the Bessel function of the first kind and $K_n(v)$ is the modified Bessel function of the second kind. For any value of v , the m -th solution u exists between u_{0m} and u_{1m} , where $J_0(u_{0m}) = 0$ and $J_1(u_{1m}) = 0$. The first, second and third solution of $m = 1, 2$ and 3 are shown in Figure 5.

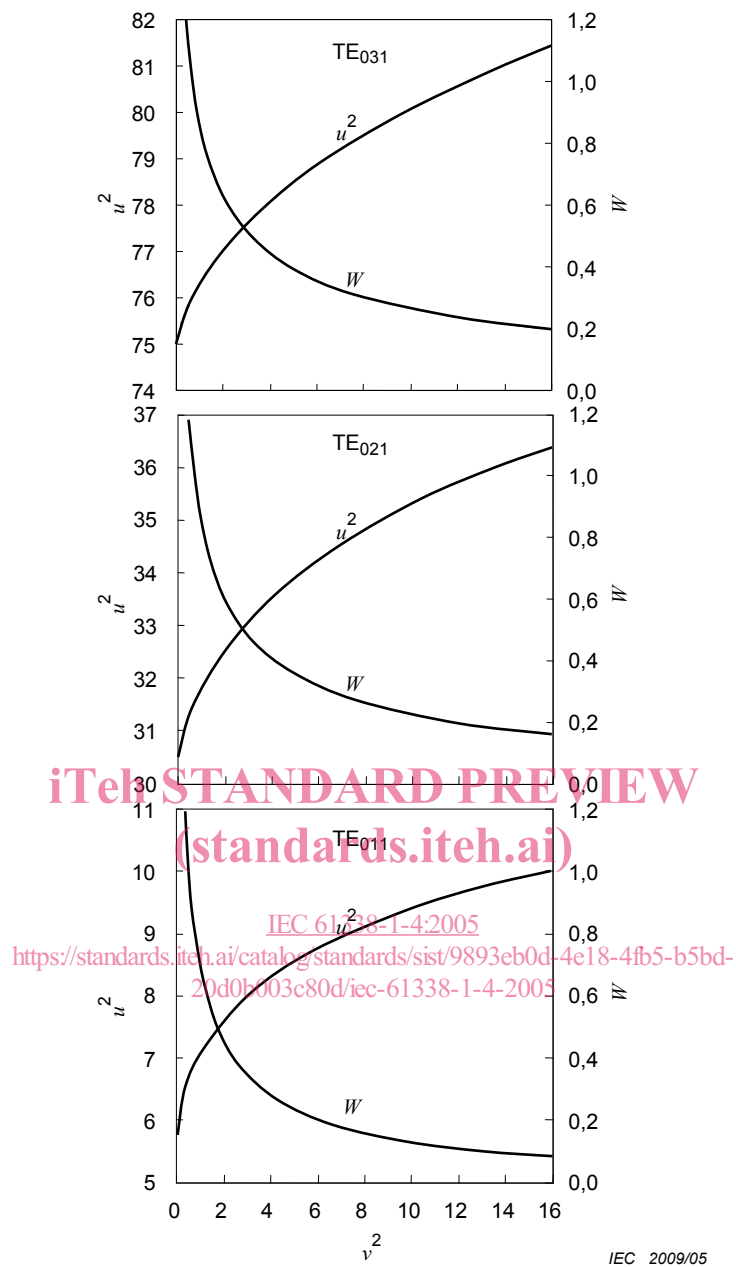

Figure 5 –Calculations of u^2 and W as a function of v^2 for TE_{011} , TE_{021} and TE_{031} resonance modes

The relative permittivity ε' is calculated by the following equation using the values v^2 and u^2 :

$$\varepsilon' = \left(\frac{\lambda_0}{\pi d} \right)^2 (u^2 + v^2) + 1 \quad (9)$$

By using the measured unloaded Q , Q_u , the loss factor $\tan \delta$ is calculated:

$$\tan \delta = \frac{A}{Q_u} - BR_S = \frac{A}{Q_u} - \frac{B'}{\sqrt{\sigma_r}} \quad (10)$$
