This **English-language** version is derived from the original **bilingual** publication by leaving out all French-language pages. Missing page numbers correspond to the French-language pages.

Publication numbering

As from 1 January 1997 all IEC publications are issued with a designation in the 60000 series. For example, IEC 34-1 is now referred to as IEC 60034-1.

Consolidated editions

The IEC is now publishing consolidated versions of its publications. For example, edition numbers 1.0, 1.1 and 1.2 refer, respectively, to the base publication, the base publication incorporating amendment 1 and the base publication incorporating amendments 1 and 2.

Further information on IEC publications

The technical content of IEC publications is kept under constant review by the IEC, thus ensuring that the content reflects current technology. Information relating to this publication, including its validity, is available in the IEC Catalogue of publications (see below) in addition to new editions, amendments and corrigenda Unformation on the subjects under consideration and work in progress undertaken by the technical committee which has prepared this publication, as well as the list of publications issued, is also available from the following:

IEC Web Site (www.iec.ch)

Catalogue of IEC publications

The on-line catalogue on the TEC web site (www.ieq.ch/searchpub) enables you to search by a variety of criteria including text searches, technical committees and date of publication. On-line information is also available on recently issued publications, withdrawn and replaced publications, as well as corrigenda.

IEC Just Published

This summary of receptly issued publications (www.iec.ch/online news/ justpub) is also available by email. Please contact the Customer Service Centre (see below) for further information.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

UNINTERRUPTIBLE POWER SYSTEMS (UPS) – Part 3: Method of specifying the performance and test requirements

FOREWORD

- 1) The IEC (International Electrotechnical Commission) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of the IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, the IEC publishes International Standards. Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. The IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of the IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested National Committees.
- 3) The documents produced have the form of recommendations for international use and are published in the form of standards, technical reports or guides and they are accepted by the National Committees in that sense.
- 4) In order to promote international unification, EC National Committees undertake to apply IEC International Standards transparently to the maximum extent possible in their national and regional standards. Any divergence between the IEC Standard and the corresponding national or regional standard shall be clearly indicated in the latter.
- 5) The IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with one of its standards.
- 6) Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. The IEC shall not be held responsible for identifying any or all such patent rights.

https://standards.iteh.i///x/p/standard/iec/9f690c09-22b7-48c3-bb3f-ce29fef6fb1a/iec-62040-3-1999

International Standard IEC 62040-3 has been prepared by subcommittee 22B: Semiconductor converters, of IEC technical committee 22: Power electronics.

This standard cancels and replaces the first edition of IEC 60146-4 published in 1986 as well as IEC 60146-5 (1988), and constitutes a technical revision.

The text of this standard is based on the following documents:

FDIS	Report on voting
22B/119/FDIS	22B/122/RVD

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

Annexes E, F and G form an integral part of this standard.

Annexes A, B, C, D, H and I are for information only.

The contents of the corrigendum of July 2003 have been included in this copy.

UNINTERRUPTIBLE POWER SYSTEMS (UPS) –

Part 3: Method of specifying the performance and test requirements

1 Scope and object

This standard applies to electronic indirect a.c. converter systems with electrical energy storage means in the d.c. link. The primary function of the uninterruptible power system (UPS) covered by this standard is to ensure continuity of an alternating power source. The uninterruptible power system may also serve to improve the quality of the power source by keeping it within specified characteristics.

A variety of uninterruptible power systems have been developed to meet consumers' requirements for continuity and quality of power for different types of loads over a wide range of power, from less than 100 W to several megawatts. Refer to annexes A and B for information on some of the types available.

This standard applies to electronic uninterruptible power systems (UPS):

- a) delivering single- or three-phase fixed frequency a.c. output voltage;
- b) with energy storage device in the d.c. link if not otherwise specified;
- c) with rated voltage not exceeding 1 000 V a.c.;
- d) movable, stationary and/or fixed equipment.

This standard also includes the method of specifying all power switches that form integral parts of a UPS and are associated with its output.

Included are interrupters, bypass switches, isolating switches, load transfer switches and tie switches. These switches interact with other functional units of the UPS to maintain continuity of load power.

This standard does not refer to conventional mains distribution boards, rectifier input switches or d.c. switches (for example for batteries, rectifier output or inverter input, etc.), or UPS based on rotating machines.

NOTE 1 - This standard recognizes that the major market usage with the UPS ratings within its scope is in conjunction with information technology equipment.

Under current technology, the majority of UPS load equipment employs power supplies which present a non-linear load to the UPS and can be tolerant of non-sinusoidal voltage waveforms for a limited time duration. UPS output ratings are specified to be compatible with non-linear loading and linear loading, subject to manufacturers' declaration if different.

References within this standard to linear loading are retained for test method reasons, or validation of manufacturers' additional declaration.

NOTE 2 — For use of UPS with a non-sinusoidal output voltage waveform, beyond the stored-energy time recommended in this standard, the agreement of the load equipment manufacturer should be sought.

NOTE 3 - For UPS output frequencies other than 50 Hz or 60 Hz, performance specification is subject to agreement between manufacturer and purchaser.

This standard is intended to define a complete uninterruptible power system in terms of its performance and not individual UPS functional units. The individual UPS functional units are dealt with in the IEC publications referred to in the bibliography given in annex I, which apply in so far as they are not in contradiction with this standard.

2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this part of IEC 62040. For dated references, subsequent amendments to, or revision of, any of these publications do not apply. However, parties to agreements based on this part of IEC 62040 are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of IEC and ISO maintain registers of currently valid International Standards.

3 Terms and definitions

For the purpose of this standard, the following definitions apply. In this standard, IEV definitions are used wherever possible, particularly those in IEC 60050(551).

3.1 Systems and components

3.1.1

uninterruptible power system (UPS)

combination of converters, switches and energy storage means, for example batteries, constituting a power system for maintaining continuity of load power (see 3.2.10) in case of input power failure

3.1.2

converter

operative unit for electronic power conversion, comprising one or more electronic valve devices, transformers and filters if necessary and auxiliaries if any [IEV 551-12-01]

3.1.3

UPS functional unit

functional unit, for example, a UPS rectifier, a UPS inverter or a UPS switch

3.1.4

UPS rectifier

an a.c./d.c. converter for rectification [IEV 551-12-07 modified]

3.1.5

UPS inverter

an a.c./d.c. converter for inversion [(EV 551-12-10 modified]

3.1.6

DC energy storage system

system consisting of single or multiple devices (typically batteries) designed to provide the required stored energy time

3.1.7

DC link

direct current power interconnection between the rectifier or rectifier/charger and the inverter functional unit

3.1.8

(secondary) battery

two or more secondary cells connected together and used as a source of electric energy [IEV 486-01-03]

3.1.9

valve regulated sealed (secondary) cell

secondary cell which is closed under normal conditions, but has an arrangement to allow gas to escape if the internal pressure exceeds a predetermined value. The battery cannot normally receive addition to the electrolyte [IEV 486-01-20]

3.1.10

vented (secondary) cell

secondary cell having a cover provided with an opening through which gaseous products may escape [IEV 486-01-18]

NOTE - The opening may be fitted with a venting system.

3.1.11

battery charger

device for changing alternating current power to direct current power for the purpose of charging a battery

3.1.12

UPS switch

switch (quenched, line or self commutated, electronic or mechanical, depending on required continuity of load power) used to connect/isolate UPS or bypass to/from load

3.1.13

transfer switch

UPS switch consisting of one or more switches used to transfer power from one source to another

3.1.14

electronic (power) switch

operative unit for electronic power switching comprising at least one controllable valve device [IEV 551-13-01]

3.1.15

mechanical UPS (power) switch

mechanical switching device capable of making, carrying and breaking currents under normal circuit conditions which may include specified operating overload conditions and also carrying for a specified time currents under specified abnormal circuit conditions such as those of short circuit [IEV 441-14-10 modified]

NOTE - A switch may be capable of making but not breaking short-circuit currents.

3.1.16

hybrid UPS (power) switch

UPS power switch with mechanical separable contacts in combination with at least one controllable electronic valve device

3.1.17

self-commutated electronic switch

electronic switch where the commutating voltage is supplied by components within the electronic switch

3.1.18

line commutated electronic switch

electronic switch where the commutating voltage is supplied by the line

3.1.19

UPS interrupter

UPS switch which is capable of making, carrying and breaking currents under normal circuit conditions, making and carrying currents for a specified time and breaking currents under specified unusual circuit conditions

3.1.20

UPS isolation switch

mechanical UPS switch which provides in the open position an isolating distance and may be capable of making, carrying and breaking currents such as circuit-breakers and disconnectors, in accordance with UPS operational requirements

3.1.21

tie switch

UPS switch which can connect two or more a.c. busbars together

3.1.22

UPS maintenance bypass switch

switch designed to isolate a section or sections of a UPS for safety during maintenance and to maintain continuity of load power via an alternative path

3.1.23

multiple function UPS switch

UPS switch performing two or more of the functions described in 3.1.19 to 3.1.22

3.1.24

AC input power

power supplied to UPS and bypass, if any, which can be either primary power or standby power

3.1.25

bypass

power path alternative to the indirect a.c. converter

3.1.26

maintenance bypass

power path designed to allow isolation of a section or sections of a UPS for safety during maintenance and/or to maintain continuity of load power. This path may be supplied with primary or standay power

3.1.27

static bypass (electronic bypass)

power path (primary or standby) alternative to the indirect a.c. converter where control is via an electronic power switch, for example transistors, thyristors, triacs or other semiconductor devices

3.1.28

UPS unit

complete UPS consisting of at least one each of the following functional units: UPS inverter, UPS rectifier and battery or other energy storage means which may operate with other UPS units to form a parallel or redundant UPS

3.1.29

single UPS

UPS comprising only one UPS unit
