## Execution of special geotechnical work - Ground anchors

Exécution des travaux géotechniques spéciaux - Tirant  
d'ancrage

Ausführung von besonderen geotechnischen Arbeiten  
(Spezialtiefbau) - Verpreßanker

This European Standard was approved by CEN on 20 February 1998.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Central Secretariat has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

SIST EN 1537:2002

<https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002>

## Foreword

This European Standard has been prepared by Technical Committee CEN/TC 288 "Execution of special geotechnical works", the secretariat of which is held by AFNOR.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by June 2000, and conflicting national standards shall be withdrawn at the latest by June 2000.

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom.

The remit of CEN/TC 288 is the standardisation of the execution procedures for geotechnical works (including testing and control methods) and of the required material properties. CEN/TC 288/WG 2 has been charged with the preparation of a Standard in the subject area of ground anchors, which includes all anchors bonded to the ground by grout and are tensioned.

The document has been prepared to stand alongside ENV 1997-1-1: Geotechnical Design, General Rules. Clause 7 "Design considerations" of this Standard deals only with those matters which should be taken into account during the execution stage of ground anchor so that the design of the anchor system may be fulfilled. The Standard, however, provides full coverage of the construction and supervision requirements. An informative Annex D provides a detailed treatment of ground anchor design.

The Standard has been drafted by a working group comprising delegates from 10 countries and is based on the review of 10 national and international codes of practice.

<https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002>

## 1 Scope

This Standard is applicable to the installation, testing and monitoring of permanent and temporary ground anchors where the load capacity is tested. An anchor consists of an anchor head, A free anchor length and a fixed anchor length which is bonded to the ground by grout. The term "ground" is taken to encompass both soil and rock.

The planning and design of ground anchors calls for experience and knowledge in this specialised field and although these topics are covered briefly in ENV 1997-1 Eurocode 7 : Geotechnical Design, Part 1 : General Rules a more detailed treatment of the design of ground anchors is included in an annex to this Standard.

The installation and testing phases require skilled and qualified labour and supervision. This Standard cannot replace the knowledge of specialist personnel and the expertise of experienced contractors required to apply the Standard.

This Standard does not address alternative systems of anchoring such as tension piles, screw anchors, mechanical anchors, soil nails, expander anchors or deadman anchors.

The Standard establishes and defines principles with regard to anchor technology. Where anchor systems do not comply with the principles defined in the text, flexibility in the use of these systems is offered by written acceptance of the Client's Technical Representative.

## 2 Normative references

This European Standard incorporates by dated or undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of any of these publications apply to this European Standard only when incorporated in it by amendment or revision. For undated references the latest edition of the publication referred to applies.

SIST EN 1537:2002

Exceptionally the list of normative references contains European Prestandards which are at the draft stage. If any of these documents becomes a European Standard the reference shall be checked.

### 3 Terms, definitions and symbols

#### 3.1 Terms and definitions

The main terms are used in common with all Eurocodes. For the purposes of this Standard the following definitions apply :

##### 3.1.1

###### **anchor**

fr : **tirant d'ancrage**

de : **Anker**

an installation capable of transmitting an applied tensile load to a load bearing stratum

##### 3.1.2

###### **anchor head**

fr : **tête d'ancrage**

de : **Ankerkopf**

the component of a ground anchor which transmits the tensile load from the tendon to bearing plate or structure

##### 3.1.3

###### **acceptance test**

fr : **essai de réception**

de : **Abnahmeprüfung**

a load test to confirm that each anchor conforms with the acceptance criteria

##### 3.1.4

###### **apparent tendon free length**

fr : **longueur libre équivalente**

de : **Rechnerische freie Stahllänge**

the length of tendon between the connection of the tendon to the stressing jack and a point along the tendon, deduced from load testing of an anchor

[SIST EN 1537:2002](https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002)

[https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-](https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002)

[5f7608972399/sist-en-1537-2002](https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002)

##### 3.1.5

###### **bleed**

fr : **ressuage**

de : **Absetzma**

the separation of water from grout paste

##### 3.1.6

###### **borehole diameter**

fr : **diamètre de forage**

de : **Bohrlochdurchmesser**

the diameter of a borehole as defined by the drill bit or casing diameter, excluding any enlargements

##### 3.1.7

###### **characteristic internal anchor resistance**

fr : **résistance interne**

**caractéristique du tirant**

de : **Charakteristischer Innerer**

**Ankerwiderstand**

the characteristic load capacity of the anchor tendon

##### 3.1.8

###### **client's technical representative**

fr : **représentant technique du client**

de : **Technischer Bauherrnvertreter**

represents the client and is fully acquainted with all aspects of the works related to the use of the anchors, including specialist knowledge of ground anchor technology

**3.1.9****coupler****fr : coupleur****de : Koppelement**

a device for joining lengths of bar or strand which comprise an anchor tendon

**3.1.10****creep limit****fr : vitesse limite de fluage****de : Grenzkriechmaß**

the maximum creep displacement rate permitted at a specific load level

**3.1.11****critical creep load****fr : traction critique de fluage****de : Kritische Kriechkraft**

the anchor load corresponding to the end of the first linear part of a plot of anchor load against creep rate

**3.1.12****datum load****fr : traction de référence****de : Vorbelastung**

the level of anchor load from which the anchor head displacement is measured during a stress test. In general, a value of 10 % proof load is adopted

**3.1.13****encapsulation****fr : protection****de : Korrosionsschutzumhüllung**

a corrosion protection applied at least to the tendon bond length

**iTeh STANDARD PREVIEW****(standards.iteh.ai)**[SIST EN 1537:2002](https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002)**3.1.14****external anchor resistance****fr : résistance externe du tirant****de : Herauszieh Widerstand des Ankers**

the load resistance of an anchor at the interface between ground and fixed anchor length

<https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002>**3.1.15****fixed anchor length****fr : longueur de scellement du tirant****de : Krafteintragungslänge**

the designed length of an anchor over which the load is transmitted to the surrounding ground, through a grout body

**3.1.16****free anchor length****fr : longueur libre du tirant****de : Freie Ankerlänge**

the distance between the proximal end of the fixed anchor length and the tendon anchorage at the anchor head

**3.1.17****grout****fr : coulis****de : Verpreßmörtel**

a setting material which transfers load from the tendon to the ground over the fixed anchor length, and which may fill the rest of the borehole and/or contribute to corrosion protection

**3.1.18****investigation test****fr : essai préalable****de : Untersuchungsprüfung**

a load test to establish the ultimate load resistance of an anchor at the grout/ground interface and to determine the characteristics of the anchor in the working load range

**3.1.19****load loss limit****fr : pert de tension admissible****de : Grenzkraftabfall**

the permitted cumulative loss of load at the end of a specified time period

**3.1.20****lock-off load****fr : traction de blocage****de : Festlegekraft**

the load transferred to an anchor head immediately on completion of a stressing operation

**3.1.21****permanent anchor****fr : tirant d'ancrage permanent****de : Daueranker**

an anchor with a design life which is in excess of two years

**3.1.22****proof load****fr : traction d'épreuve****de : Prüfkraft**

the maximum test load to which an anchor is subjected

**3.1.23****suitability test****fr : essai de contrôle****de : Eignungsprüfung**

a load test to confirm that a particular anchor design will be adequate in particular ground conditions

**iTeh STANDARD PREVIEW**  
(standards.iteh.ai)

**3.1.24****system test****fr : essai de système****de : Systemprüfung**

a test which is carried out on an anchor system to verify its competence to perform as required

[SIST EN 1537:2002](https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002)<https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002>**3.25****temporary anchor****fr : tirant d'ancrage provisoire****de : Kurzzeitanker**

an anchor with a design life of less than two years

**3.1.26****tendon****fr : armature****de : Zugglied**

the part of a ground anchor that is capable of transmitting the tensile load from the fixed anchor length to the anchor head

**3.1.27****tendon bond length****fr : longueur de scellement de l'armature****de : Verankerungslänge des Zugliedes**

the length of the tendon that is bonded directly to the grout and capable of transmitting the applied tensile load

**3.1.28****tendon free length****fr : longueur libre de l'armature****de : Freie Stahllänge**

the length of tendon between the anchor head and the proximal end of the tendon bond length

A typical anchor is shown in Figure 1.

### 3.2 Symbols

$A_t$	Cross sectional area of anchor tendon
$E_d$	Design value of the effect of an action
$E_{d,dst}$	Design value of the effect of destabilising action
$E_{d,stab}$	Design value of the effect of stabilising action
$E_t$	Elastic modulus of anchor tendon
$f$	Friction loss as a percent of $P_p$
$f_{tk}$	Characteristic tensile strength of a tendon
$f_{t0,1k}$	Characteristic tensile stress at which there is a permanent strain of 0,1%
$f_r$	Relative area of ribs of ribbed or profiled wire or bar
$k_s$	Creep displacement rate
$k_1$	Load loss
$L_{app}$	Apparent tendon free length
$L_e$	External length of tendon measured from the tendon anchorage in the anchor head to the anchorage point in the stressing jack
$L_{fixed}$	Fixed anchor length
$L_{free}$	Free anchor length
$L_{tb}$	Tendon bond length
$L_{tf}$	Tendon free length
$P$	Anchor tendon load
$P_a$	Datum load
$P_c$	Critical creep load
$P_c'$	Approximation to critical creep load
$P_o$	Anchor lock-off load
$P_p$	Proof load
$P_{tk}$	Characteristic load capacity of tendon
$P_{t0,1k}$	Characteristic tensile load at which there is a permanent strain of 0,1 %
$R_u$	External anchor resistance
$R_{ak}$	Characteristic external anchor resistance
$R_{ik}$	Characteristic internal anchor resistance

$R_d$	Design resistance of an anchor
$R_k$	Lower of characteristic internal and external resistances
$s$	Anchor head displacement
$t$	Time from application of load increment or load lock-off
$\alpha$	Slope of creep displacement/log time plot
$\Delta P$	Difference between proof load and anchor datum load
$\Delta s$	Measured extension of anchor tendon under load increment $\Delta P$
$\gamma_q$	Variation factor for anchor load
$\gamma_R$	Partial factor on anchor resistance

### Key

1	Anchorage point at jack during stressing	6	Soil/rock
2	Anchorage point at anchor head in service	7	Borehole
3	Bearing plate	8	Debonding sleeve
4	Load transfer block	9	Tendon
5	Structural element	10	Grout body

Figure 1 — Sketch of a ground anchor - Details of anchor head and head protection omitted

## 4 Specific needs

### 4.1 General

Ground anchors can only be designed efficiently on the basis of a sound knowledge of the construction project, of the structural requirements of the anchor and of the geotechnical properties of the ground. Anchor testing and the verification of design parameters are necessary elements in the construction procedure for economical installation of effective ground anchors.

The responsibilities of all parties involved in the design, execution, testing and maintenance of the ground anchors shall be defined. Table 1 shows, as a guide, an appropriate separation of design and execution activities.

**Table 1 — Design and execution activities**

Overall design activities	Specialist execution activities
<ol style="list-style-type: none"> <li>1. Provision of site investigation data for construction of ground anchors</li> <li>2. Decision to use ground anchors, required trials and testing and provision of a specification</li> <li>3. Acquisition of legal authorisation and entitlement to encroach on third party property</li> <li>4. Overall design of anchored structure, calculations of anchor force required. Definition of safety factors to be employed.</li> <li>5. Definition of ground anchor life (permanent/temporary) and requirement for corrosion protection.</li> <li>6. Specification of anchor spacing and orientation, anchor loads and overall stability requirements.</li> <li>7. Specification of minimum distance from the structure to mid fixed length to ensure stability of the structure.</li> <li>8. Specification of load transfer mechanism from the anchor to the structure.</li> <li>9. Specification of any sequence of anchor loading required of the structure and the appropriate load levels.</li> <li>10. Specification of systems for monitoring ground anchor behaviour and for interpretation of results.</li> <li>11. Supervision of the works</li> <li>12. Specification of maintenance for ground anchors.</li> <li>13. Instruction to all parties involved of key items in the design philosophy to which special attention should be directed.</li> </ol>	<ol style="list-style-type: none"> <li>1. Assessment of site investigation data with respect to design assumptions.</li> <li>2. Selection of ground anchor components and details.</li> <li>3. Determination of fixed anchor dimensions.</li> <li>4. Detailing of the corrosion protection system for the ground anchor.</li> <li>5. Supply and installation of the ground anchor system.</li> <li>6. Supply and installation of the ground anchor monitoring system.</li> <li>7. Quality control of works.</li> <li>8. Execution and assessment of anchor tests.</li> <li>9. Evaluation of on-site anchor tests</li> <li>10. Maintenance of ground anchor as directed</li> </ol>

Sufficient information to assist in the design and installation of ground anchors should be provided prior to, and updated during, the execution of the works.

**NOTE** The whole design or some parts of the design may be performed by the client, the main contractor, a specialist contractor or by a consultant.

#### 4.2 Planning of anchor works

The following shall be provided prior to the initial supply and installation of the ground anchor system :

- details of the ground anchor project and the construction sequence and programme ;
- a site investigation report incorporating a geotechnical classification and engineering properties of the ground in which the ground anchors are to be located ;
- information on all other boundary conditions, including underground services, existing foundations and requirements relevant to the location and performance of the ground anchors ;
- details of ownership of the ground into which the anchors are to be installed ;
- details of any agreement required to gain access to ground into which the anchors are to be installed.

The amount of investigative and design work depends upon the type and size of the project, the complexity of the ground and the degree of risk involved.

## 5 Site investigation

The ground is a vital element of the ground anchor system, therefore a good quality geotechnical investigation is essential. A common cause of individual anchor failure at the acceptance testing stage is the lack of accurate information on the ground conditions local to the anchor.

Since inclined ground anchors are installed as commonly as vertical anchors, lateral variations in ground properties should be investigated as thoroughly as the vertical variations.

All geotechnical investigation shall be undertaken in accordance with the requirements and recommendations of ENV 1997-1-1 Eurocode 7, Part 1.

Geotechnical investigation should be extended to site extremities so that the strata profile may be interpolated between the investigation locations rather than extrapolated outside the area investigated. Where possible it should be extended to include ground formations outside the actual site if stresses induced by anchors are extended there.

Depths of geotechnical investigation should be adequate to ensure that :

- a) a known geological formation is proved ; or
- b) no underlying stratum will affect design ; and
- c) groundwater conditions are well defined.

Iteh STANDARD PREVIEW  
(standards.iteh.ai)

In addition to the lithology and structure of the ground in accordance with ENV 1997-1 Eurocode 7, Part 1, the following shall also be known, where applicable : [SIST EN 1537:2002](https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002)

<https://standards.iteh.ai/catalog/standards/sist/5c769f12-b059-4e4e-a3e9-5f7608972399/sist-en-1537-2002>

- a) for soils :
  - soil description and classification (grading, moisture content, unit weight, relative density, Atterberg limits) ;
  - shear strength, compressibility and radial stiffness ;
  - permeability ;
  - ground water conditions ;
  - corrosion potential of soil and ground water ;
  - existence of stray electric currents ;
- b) for rocks :
  - classification (geometry of discontinuities, unit weight, degree of weathering, index tests) ;
  - rock stratification ;
  - unconfined compression strength of intact rock ;
  - shear strength and deformability of rock mass ;
  - permeability ;
  - ground water conditions ;
  - corrosion potential of rock and ground water ;

- existence of stray electric currents.

From this information, it should be possible to determine the likelihood of difficulties relating to :

- potential obstructions to drilling ;
- the process of borehole drilling (drillability) ;
- borehole stability ;
- flow of ground water into the borehole ;
- loss of grout from the borehole.

## 6 Materials and products

### 6.1 General

Anchor systems shall be used for which successful experience with respect to performance and durability has been documented.

All anchor systems shall have been subjected to at least one system test to verify the competence of the system. The results of all tests shall be documented in detail.

The documented system test shall be approved by the Client's Technical Representative in accordance with principles stated in this Standard.

All materials used shall be mutually compatible. This applies in particular to adjacent materials with a common interface. Material properties shall not change during the design life of the ground anchor in such a way that the anchor loses its serviceability.

Anchors involving the use of newly developed materials or methods of execution are permitted subject to the performance of the anchor and durability of the materials used being proven by system tests and approved by the Client's Technical Representative to ensure that the serviceability of the anchor system is maintained for the design life of the anchored structure.

### 6.2 Tendon

All steel tendons shall comply with the following European Standards :

- |                     |   |
|---------------------|---|
| Construction steel  | - ENV 1993-1 : Eurocode 3 : Design of steel structures - Part 1 : General rules ;               |
| Steel reinforcement | - ENV 1992-1-1 : Eurocode 2 : Design of concrete structures - Part 1 : General rules ;          |
| Prestressing steel  | - prEN 10138: Design of prestressing steel ;  |
|                     | - prENV 1992-1-5 : Eurocode 2 Part 1- 5: The use of unbonded and external prestressing tendons. |

Other tendon materials may only be used if their suitability as anchor components have been proven and they are approved by the Client's Technical Representative

### 6.3 Anchor head

The anchor head shall allow the tendon to be stressed, proof loaded and locked-off and, if required, released, destressed and restressed. It shall be able to carry the characteristic tensile load of the tendon of 100 %  $P_{tk}$ .
