TECHNICAL REPORT

IEC TR 60344

Third edition
2007-02

Calculation of d.c. resistance of plain and coated copper conductors of low-frequency cables and wires – Application guide

Reference number
IEC/TR 60344:2007(E)

Publication numbering

As from 1 January 1997 all IEC publications are issued with a designation in the 60000 series. For example, IEC 34-1 is now referred to as IEC 60034-1.

Consolidated editions

The IEC is now publishing consolidated versions of its publications. For example, edition numbers 1.0, 1.1 and 1.2 refer, respectively, to the base publication, the base publication incorporating amendment 1 and the base publication incorporating amendments 1 and 2.

Further information on IEC publications

The technical content of IEC publications is kept under constant review by the IEC, thus ensuring that the content reflects current technology. Information relating to this publication, including its validity, is available in the IEC Catalogue of publications (see below) in addition to new editions, amendments and corrigenda. Information on the subjects under consideration and work in progress undertaken by the technical committee which has prepared this publication, as well as the list of publications issued, is also available from the following:

- **IEC Web Site (www.iec.ch)**

- **Catalogue of IEC publications**

  The on-line catalogue on the IEC web site (www.iec.ch/searchpub) enables you to search by a variety of criteria including text searches, technical committees and date of publication. On-line information is also available on recently issued publications, withdrawn and replaced publications, as well as corrigenda.

- **IEC Just Published**

  This summary of recently issued publications (www.iec.ch/online_news/ justpub) is also available by email. Please contact the Customer Service Centre (see below) for further information.

- **Customer Service Centre**

  If you have any questions regarding this publication or need further assistance, please contact the Customer Service Centre:

INTERNATIONAL ELECTROTECHNICAL COMMISSION

CALCULATION OF DC RESISTANCE OF PLAIN AND COATED COPPER CONDUCTORS OF LOW-FREQUENCY CABLES AND WIRES – APPLICATION GUIDE

FOREWORD

1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
5) IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with an IEC Publication.
6) All users should ensure that they have the latest edition of this publication.
7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

IEC 60344, which is a Technical Report, has been prepared by subcommittee 46C: Wires and symmetric cables, of IEC technical committee 46: Cables, wires, waveguides, r.f. connectors, r.f. and microwave passive components and accessories.

The main task of IEC technical committees is to prepare International Standards. However, a technical committee may propose the publication of a technical report when it has collected data of a different kind from that which is normally published as an International Standard, for example "state of the art".

This third edition cancels and replaces the second edition published in 1980 and amendment 1 (1985). This edition constitutes a technical revision.

This edition includes the following significant technical change with respect to the previous edition:

– improvement of the calculation method of the resistance of copper conductors.
– the content was considered more appropriate for the publication of a Technical Report rather than a International Standard.

The text of this technical report is based on the following documents:

Enquiry draft	Report on voting
46C/761/DTR	46C/795A/RVC

Full information on the voting for the approval of this technical report can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this publication will remain unchanged until the maintenance result date indicated on the IEC web site under "http://webstore.iec.ch" in the data related to the specific publication. At this date, the publication will be

- reconfirmed;
- withdrawn;
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

The contents of the corrigendum of February 2012 have been included in this copy.

CALCULATION OF DC RESISTANCE OF PLAIN AND COATED COPPER CONDUCTORS OF LOW-FREQUENCY CABLES AND WIRES – APPLICATION GUIDE

1 Scope

This Technical Report applies to low-frequency cables and wires for telecommunication and gives a general method for calculating the resistance of copper conductors.

2 General method of calculation

The maximum conductor resistance, R, at 20 °C of insulated copper conductors is equal to

$$R = R_0\, k_1\, k_2\, k_3\, k_4 \quad \Omega/\text{km}$$

where

$$R_0 = \frac{21{,}95}{n d^2}$$

n is the number of strands in the conductor (for a solid conductor n = 1);

d is the nominal diameter of the strands in the conductor, in millimetres, or, for a solid conductor, its nominal diameter;

k_1 is a factor depending on the diameter of the strands and on plain or coated conductor. Values for k_1 are given in Table 1;

k_2 is a factor depending on the type of conductor; the value is equal to

1,00 for solid conductors;

1,04 for stranded conductors;

k_3 is a twisting factor depending on conductor dimension and the way the insulated conductors are twisted together (for single wires k_3 = 1). Values for k_3 are given in Table 2;

k_4 is, for cables with more than one cabling element, a cabling factor depending on conductor size and on the way the cabling elements are assembled, or, for cables with one cabling element and for screened wires up to and including five insulated conductors, an elongation factor depending on conductor size. Values for k_4 are given in Table 3. Values of R are given in Table 4. These values are calculated with different coefficients k_1, k_2, k_3, k_4. The result of the calculations is given with six significant figures. In publications, the value chosen in this table shall be indicated with three significant figures for R below 1 000, and four significant figures from 1 000; for this the table value shall be rounded off to the nearest value.

NOTE The copper conductivity is 58 m/Ωmm².

Table 1 – Strand nominal diameter

Nominal diameter of strands in conductor mm	Values of k_1					
	Solid conductor			Stranded conductor		
	Nickel coated	Tinned	Plain or silver plated	Nickel coated	Tinned	Plain or silver plated
Over 0,05 up to and including 0,10	–	–	–	1,20	1,12	1,07
Over 0,10 up to and including 0,31	1,16	1,08	1,05	1,15	1,07	1,04
Over 0,31 up to and including 0,91	1,13	1,05	1,03	1,12	1,04	1,02
Over 0,91 up to and including 3,60	–	1,04	1,03	–	1,03	1,02

Table 2 – Twisting lay factor

Twisting lay factor	Values of k_3					
	Nominal diameter of solid conductors d mm			Nominal cross-section of stranded conductors S mm^2		
	$d \geq 0,8$	$0,8 > d \geq 0,4$	$d < 0,4$	$S \geq 0,5$	$0,5 > S \geq 0,15$	$S < 0,15$
>16	1,02	1,03	1,04	1,02	1,03	1,04
≤16	1,05	1,06	1,07	1,05	1,06	1,07
NOTE The twisting lay factor is the ratio of twisting lay length to overall diameter of the twisted insulated conductors.						

Table 3 – Cabling lay factor

Cabling lay factor	Values of k_4			
	Nominal diameter of solid conductors d mm		Nominal cross-section of stranded conductors S mm^2	
	$d \geq 0,8$	$d < 0,8$	$S \geq 0,5$	$S < 0,5$
>16	1,02	1,03	1,02	1,03
≤16	1,05	1,06	1,05	1,06

NOTE 1 The cabling lay factor is the ratio of stranding lay to overall diameter of the assembled layer.

NOTE 2 For screened wires, k_4 is determined by reference to the value associated with a cabling lay factor greater than 16.

Table 4 – Solid conductor

Nominal conductor diameter mm	Coefficients				Calculated resistance Ω/km
	k_1	k_2	k_3	k_4	
0,12	1,05 1,08 1,16	1,00 1,00 1,00	1,00 1,00 1,00	1,00 1,00 1,00	1 600,52 1 646,25 1 768,19
