**Descriptors :** road vehicles, caravans, drawbars, computation, mechanical strength.

## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of developing International Standards is carried out through ISO technical committees. Every member body interested in a subject for which a technical committee has been authorized has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work.

Draft International Standards adopted by the technical committees are circulated to the member bodies for approval before their acceptance as International Standards by the ISO Council.

International Standard ISO 7641/1 was developed by Technical Committee ISO/TC 22, *Road vehicles*, and was circulated to the member bodies in September 1982.

iTeh STANDARD PREVIEW  
(standards.iteh.ai)

It has been approved by the member bodies of the following countries:

|                     |                        |                       |
|---------------------|------------------------|-----------------------|
| Australia           | Germany, F.R.          | Romania               |

No member body expressed disapproval of the document.

# Road vehicles — Caravans and light trailers — Calculation of the mechanical strength of the drawbar — Part 1 : Steel drawbars

## iTeh STANDARD PREVIEW (standards.iteh.ai)

### 1 Scope

This part of ISO 7641 gives a simplified procedure for the calculation of the mechanical strength of drawbars for caravans and light trailers<sup>1)</sup> where the vertical static load on the coupling head does not exceed the limits specified in ISO/TR 4114.

The welding procedure requirements given by the manufacturer shall be met (preheating, for example).

Drawbars made from other materials will be dealt with in ISO 7641/2.

### 2 Field of application

Calculations shown in this part of ISO 7641 apply only to steel drawbars, of welded and other than welded construction.

For welded drawbars, only those types of steel which contain not more than 0,22 % carbon and the weldability of which is guaranteed by the manufacturer shall be used.

### 3 References

1) Categories 01 and 02 as in ECE/UNO classification.

4 Symbols and definitions

Figure 1 — Drawbar sketch

$l$  is the distance, in metres, from the vertical axis of the coupling device to the first fixing point on the trailer frame;

$l_x$  is the distance, in metres, from the vertical axis of the coupling device to the drawbar section corresponding to the maximum strain rate;

$e$  is the distance, in metres, from the horizontal axis of the coupling device to the drawbar neutral fibre at the first fixing point on the trailer frame;

$e_x$  is the distance, in metres, from the horizontal axis of the coupling device to the drawbar neutral fibre at the cross section corresponding to the maximum strain rate;

$P$  is the maximum manufacturer's total mass, in kilogrammes (see ISO 7237);

$D$  is the value, in newtons, determined by calculation for the longitudinal forces occurring between tractor vehicle and trailer :

$$D = g \times \frac{22\,000 \times P}{22\,000 + P}$$

$k$  is the coefficient for a drawbar longer than 2,5 m to be determined as follows :

$$k = 1,25 - 0,1 l \text{ with } k_{\min} = 0,6$$

5 Resistance calculation

The calculation shall be carried out over the whole length  $l$  of the drawbar taking into account distances  $l_x$  and  $e_x$  in order to determine maximum strain rate. The strain rate shall be checked at the position where the maximum bending moment occurs when  $l = l_x$  and  $e = e_x$ .

5.1 Calculation of the maximum bending moment, expressed in newton metres, for the drawbar with  $e/l < 0,15$  and  $e_x/l_x < 0,15$

Only flexure is taken into account for the calculation.

5.1.1 Drawbars of length 2,5 m or less :

— for braked trailers :

$$M_f = 0,36 P g l_x$$

— for unbraked trailers :

$$M_f = 0,24 P g l_x$$

5.1.2 Drawbars of length greater than 2,5 m :

— for braked trailers :

$$M_f = 0,36 P g k l_x$$

— for unbraked trailers :

$$M_f = 0,24 P g k l_x$$

5.2 Calculation of the maximum bending moment, expressed in newton metres, for drawbars with  $e/l > 0,15$  and  $e_x/l_x > 0,15$

Only flexure is taken into account for the calculation.

Three bending moments,  $M_f$ ,  $M_{fD}$  and  $M_{fR}$  shall be calculated; the largest value of the three shall be used for the calculation of the maximum admissible stress ( $M_{f\max}$ ).

**5.2.1 Drawbars of length 2,5 m or less :**

- for braked trailers :

$$M_f = 0,36 P g l_x$$

$$M_{fD} = 0,8 D e_x$$

$$M_{fR} = 0,75 (M_f + M_{fD})$$

- for unbraked trailers :

$$M_f = 0,24 P g l_x$$

$$M_{fD} = 1,0 D e_x$$

$$M_{fR} = 0,75 (M_f + M_{fD})$$

**5.2.2 Drawbars of length greater than 2,5 m :**

- for braked trailers :

$$M_f = 0,36 P g k l_x$$

$$M_{fD} = 0,8 D e_x$$

$$M_{fR} = 0,75 (M_f + M_{fD})$$

- for unbraked trailers :

$$M_f = 0,24 P g k l_x$$

$$M_{fD} = 1,0 D e_x$$

$$M_{fR} = 0,75 (M_f + M_{fD})$$

**5.3 Permissible stress**

Stress rates  $\sigma$  calculated for the whole length of the drawbar shall not exceed the allowed stress  $\sigma_c$  :

$$\sigma = \frac{M_f}{\frac{I}{V}}$$

where

$\frac{I}{V}$  is the section modulus of drawbar cross-section corresponding to the maximum bending moment.

**5.3.1 Drawbars fabricated by means other than welding :**

$$0,6 \sigma_{B \min} > \sigma_c < 0,8 \sigma_s$$

where

$\sigma_c$  is the permissible stress, in newtons per square millimetre;

$\sigma_B$  is the ultimate tensile stress, in newtons per square millimetre;

$\sigma_s$  is the yield stress, in newtons per square millimetre.

**5.3.2 Welded drawbars :-**

$$0,45 \sigma_{B \min} > \sigma_c < 0,65 \sigma_s$$
