## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

All published ETSI deliverables shall include information which directs the reader to the above source of information.

---

## Foreword

This Technical Report (TR) has been produced by ETSI Project Telecommunications and Internet Protocol Harmonization Over Networks (TIPHON).

## iTeh STANDARD PREVIEW (standards.iteh.ai)

SIST-TP TR 102 129 V1.1.1:2004  
<https://standards.iteh.ai/catalog/standards/sist/2c3730b5-af3b-4dc5-a531-2bd5ca97e553/sist-tp-tr-102-129-v1-1-1-2004>

## 1 Scope

The objective of ETSI Project TIPHON is the specification of interoperability mechanisms and related parameters to enable multimedia communications (particularly voice) to take place, to a defined quality of service, between Switched Circuit Networks (SCN) and Internet Protocol (IP) based networks and their associated terminal equipment.

The present document presents an overview of the architecture, protocols, QoS and security concepts for the interworking between TIPHON and IPCablecom systems. It introduces a possible framework for convergence between TIPHON and IPCablecom.

Annexes A and B give a general overview of IPCablecom and TIPHON.

Annex C addresses architectural issues for interworking between TIPHON and IPCablecom systems.

Annex D provides information on the protocol aspects relating to TIPHON and IPCablecom system interworking.

Annex E examines TIPHON and IPCablecom QoS Policies, architectures and the control of network resources

Annex F reviews TIPHON and IPCablecom security policies and describes the results of a threat analysis.

## 3 Definitions and abbreviations

### 3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

**authentication header:** IPSec security protocol that provides message integrity for complete IP packets, including the IP header

**Application-Specific Data:** application-specific field in the IPSec header that along with the destination IP address provides a unique number for each SA

**Baseline Privacy Interface Plus (BPI+):** security portion of the ITU-T Recommendation J.112 standard that runs on the MAC layer

**Certification Authority (CA):** trusted organization that accepts certificate applications from entities, authenticates applications, issues certificates and maintains status information about certificates

**Call Agent (CA):** part of the CMS that maintains the communication state, and controls the line side of the communication

**Call Management Server (CMS):** controls the audio connections

NOTE: Also called a Call Agent in MGCP/SGCP terminology. This is one example of an Application Server.

**DiffServ Code Point (DSCP):** field in every IP packet that identifies the DiffServ per hop behaviour

NOTE: In IP version 4, the Type Of Service (TOS) byte is redefined to be the DSCP. In IP version 6, the traffic class octet is used as the DSCP.

**Hashed Message Authentication Code (HMAC):** message authentication algorithm, based on either SHA-1 or MD5 hash and defined in IETF RFC 2104

**Internet Key Exchange (IKE):** key management mechanism used to negotiate and derive keys for SAs in IPSec

**IKE-:** IKE with pre-shared keys for authentication

**IKE+:** notation defined to refer to the use of IKE, which requires digital certificates for authentication

**Message Authentication Code (MAC):** fixed-length data item that is sent together with a message to ensure integrity, also known as a MIC

**Operational Support System (OSS):** back-office software used for configuration, performance, fault, accounting, and security management

## iTeh STANDARD PREVIEW

**Public Key Infrastructure (PKI):** process for issuing public key certificates, which includes standards, certification authorities, communication between authorities and protocols for managing certification processes

**quintet:** UMTS authentication vector

[SIST-TP TR 102 129 V1.1.1:2004](#)

**Record Keeping Server (RKS):** device which collects and correlates the various event messages

[2bd5ca97e553/sist-tp-tr-102-129-v1-1-1-2004](#)

**Signalling Gateway (SG):** signalling agent that receives/sends SCN native signalling at the edge of the IP network

NOTE: In particular the SS7 SG function translates variants ISUP and TCAP in an SS7-Internet Gateway to a common version of ISUP and TCAP.

**Session Initiation Protocol (SIP):** application-layer control (signalling) protocol for creating, modifying, and terminating sessions with one or more participants

**Signalling System number 7 (SS7):** architecture and set of protocols for performing out-of-band call signalling with a telephone network

**triplet:** GSM authentication vector

**Transaction Capabilities Application Protocol (TCAP):** protocol within the SS7 stack that is used for performing remote database transactions with a Signalling Control Point

**Ticket Granting Server (TGS):** sub-system of the KDC used to grant Kerberos tickets

## 3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

|     |                                   |
|-----|-----------------------------------|
| AN  | Access Node                       |
| ANC | ANnouncement Controller           |
| ANP | ANnouncement Player               |
| ANS | ANnouncement Server               |
| AOC | Advice Of Charge                  |
| API | Application Programming Interface |

|         |   |
|---------|---|
| ATM     | Asynchronous Transfer Mode                                |
| BICC    | Bearer Independent Call Control                           |
| BNF     | Backus-Noun Form  |
| BPI+    | Baseline Privacy Interface Plus                           |
| BRI     | Basic Rate ISDN   |
| C7      | Signalling System Number 7                                |
| CA      | Call Agent  |
| CA      | Certification Authority                                   |
| CC      | Call Control  |
| CDR     | Call Detail Record  |
| CLIR    | COnnected Line Identity Restriction                       |
| CM      | Cable Modem   |
| CMS     | Call Management Server                                    |
| CMSS    | Call Management Server Signalling (CMS to CMS) signalling |
| CMTS    | Cable Modem Termination System                            |
| COLP    | COnnected Line identity Presentation                      |
| COPS    | Common Open Policy Service                                |
| CS      | Circuit Switched  |
| CUG     | Closed User Group   |
| DCS     | Distributed Call Signalling                               |

ITEH STANDARD PREVIEW  
(standards.iteh.ai)

## 4 Overview

The study was initially conducted to identify what was needed to be done for convergence between IPCablecom and TIPHON. However, it was recognized that this task was extremely ambitious, hence the present document describes an analysis of interworking between IPCablecom and TIPHON.

Three interworking scenarios have been defined, interworking through:

- Switched Circuit Network interfaces.
- Media Gateway Control interfaces.
- Session Initiation Protocol interfaces.

The main issues are addressed in the remainder of clause 4 of the present document.

Of interest are the limitations on end-end QoS and security introduced by interworking between TIPHON and IPCablecom systems.

The three interworking scenarios are summarized in the following clauses.

### 4.1 Interworking through SCN Interfaces

Both TIPHON and IPCablecom support an SCN interface for basic call. The signalling is done through ISUP whilst the media transfer is either PSTN or IP in the case of TIPHON and only PSTN for IPCablecom at this point in time. It is likely that IPCablecom will evolve to ISDN.

#### iTeh STANDARD PREVIEW

This interworking assumes that TIPHON completes the protocol mapping to ISUP. When the protocol mapping to ISUP is completed, then the TIPHON Release 3 basic call will be supported.  
(standards.itech.ai)

That interworking could be assured either through an actual network which would act as a transit network or without an intermediate network in a piggy back fashion (like a null modem). In the later case, one network plays the role of the PSTN and the other plays its normal role.

<https://www.itech.ai/catalog/standards/sist-tp-tr-102-129-v1-1-2004-2bd5ca97e553/sist-tp-tr-102-129-v1-1-2004>

The advantage of this interworking through SCN Interfaces approach is that it could be readily available.

The drawbacks of this interworking through SCN Interfaces approach are the weaknesses in terms of loss of capabilities in the areas of security and QoS. ISUP does not offer QoS parameter negotiation and does not support security mechanisms for signalling.

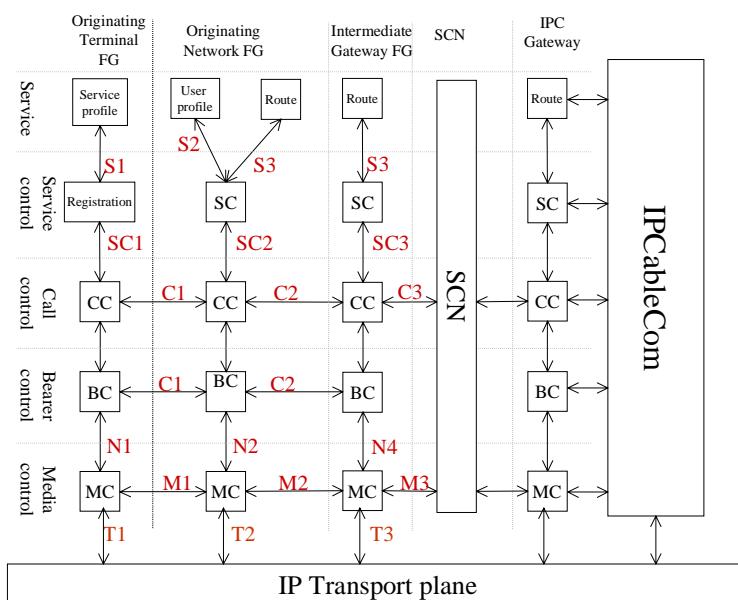

Figure 1: IPCablecom interworking with TIPHON through SCN
