

Designation: D6691 – 01

# Standard Test Method for Determining Aerobic Biodegradation of Plastic Materials in the Marine Environment by a Defined Microbial Consortium<sup>1</sup>

This standard is issued under the fixed designation D6691; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

## 1. Scope

1.1 This test method is used to determine the degree and rate of aerobic biodegradation of plastic materials (including formulation additives) exposed to pre-grown population of at least ten aerobic marine microorganisms of known genera. The test method is conducted under controlled laboratory conditions.

1.2 This test method is designed to index polymer materials that are possibly biodegradable, relative to a positive reference material, in an aerobic environment.

1.3 This test method is applicable to all polymer materials containing at least 20 % carbon that are not inhibitory to the microorganisms present in a marine environment.

1.4 The values stated in SI units are to be regarded as the standard.

1.5 There is no similar or equivalent ISO standard.

1.6 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

## 4. Summary of Test Method

4.1 This test method consists of the following:

4.1.1 Selecting and characterizing (carbon content, molecular weight) plastic materials for testing,

4.1.2 Preparing a uniform inoculum of various isolated marine microorganisms,

4.1.3 Exposing the test materials to the inoculum,

4.1.4 Using a respirometer to measure the total biogas (CO<sub>2</sub>) produced as a function of time, and

4.1.5 Assessing the degree of biodegradability.

4.2 Biodegradability is assessed by determining the proportion of polymer-C converted to biogas-C. The percent of theoretical gas production, expressed as a fraction of the measured or theoretical carbon content of the test material, is reported as a function of time.

## 5. Significance and Use

5.1 The use of plastics aboard ships is on the rise and the use of the sea as a trash dumping site is no longer a possibility; consequently, the disposal of plastic materials while at sea remains a major issue. Biodegradable plastics may help to allay public concern by allowing for the safe disposal of plastic materials at sea. This test method has been developed to assess the rate and degree of aerobic biodegradation of plastics exposed to marine microorganisms. Aerobic biodegradation is determined by measuring the amount of biogas (carbon dioxide) produced during such an exposure.

5.2 The degree and rate of aerobic biodegradability of a plastic under the conditions of this test method may be used to estimate the persistence of that plastic in biologically active marine environments, for example, seashore and open-ocean. However, it shall be recognized that predicting long-term environmental fate and effects from the results of short-term exposure to a simulated marine environment is difficult. Thus, caution shall be exercised when extrapolating the results obtained from this or any other controlled-environment test to disposal in the natural environment.

## 6. Apparatus

6.1 *Aerobic Digestion and Gas Measuring Apparatus:*

6.1.1 Biogas production can be monitored through the use of any number of respirometry systems. The respirometry system must be able to detect low levels of carbon dioxide

production. A carbon dioxide sensor consisting of a single beam, nondispersive infrared device with a maximum measurement capability of 1 % carbon dioxide is recommended.

6.1.2 *Sample Bottles*—125-mL autoclave bottles with plastic, screw-on lids. The lids shall contain three entry ports for biogas collection as well as a tetrafluorethylene seal ring. These flasks as well as their lids are supplied by the various respirometry companies.

6.1.3 All components of the gas-volume measuring and collection system must be of sufficient quality to prevent gas diffusion between the system and the surrounding atmosphere.

6.2 *Water Bath or Controlled-Environment Shaker/Incubator*, capable of maintaining the temperature of the digestion flasks at  $30 \pm 2^\circ\text{C}$ .

6.3 *Analytical Balance*, ( $\pm 0.1$  mg), to weigh the test materials.

## 7. Reagents and Materials

7.1 All chemicals shall be of American Chemical Society (ACS) reagent-grade quality.

7.2 Type IV distilled water shall be prepared in accordance with Specification **D1193**.

7.3 Marine agar per litre consists of the following:

Bacto tryptone	5.0 ± 0.1 g
Bacto yeast extract	2.5 ± 0.1 g
Bacto dextrose (glucose)	1.0 ± 0.1 g
Bacto agar	15.0 ± 0.1 g

7.4 Marine broth per litre consists of the following:

Peptone	5.0 ± 0.1 g
Yeast extract	1.0 ± 0.1 g
Ferric citrate	0.1 ± 0.1 g
Sodium chloride	19.4 ± 0.1 g
Magnesium chloride, dried	5.9 ± 0.1 g
Sodium sulfate	3.24 ± 0.1 g
Calcium chloride	1.8 ± 0.1 g
Potassium bromide	0.08 ± 0.1 g
Strontium chloride	34.0 ± 0.1 mg
Boric acid	4.0 ± 0.1 mg
Sodium silicate	4.0 ± 0.1 mg
Sodium fluoride	2.4 ± 0.1 mg
Ammonium nitrate	1.6 ± 0.1 mg
Disodium phosphate	8.0 ± 0.1 mg

7.5 *Marine Solution*—Refer to **Table 1**. All of the components must be mixed with 1 L of reagent grade, sterile water, until all of the salts have disappeared.

7.6 *Reference Materials*—Cellulose, chitin and Kraft paper, or all three, can act as the positive control and solitary inoculum as the negative control. Reference materials shall be provided in the same form as the test specimens, that is, powders, films, foams, and so forth. Sodium bicarbonate (100 mg) and sodium sulfite (100 mg) in an acidic water solution (100 mL) shall be tested also to ensure that the CO<sub>2</sub> sensors of the respirometry apparatus are functioning properly.

**TABLE 1 Components of Minimal Marine Solution**

Substance	Formula	MW, g/mol	Concentration, g/L
Ammonium chloride	NH <sub>4</sub> Cl	53.49	2.00 ± 0.05
Synthetic sea salt	...	...	17.50 ± 0.05
Magnesium sulfate, 7-hydrate	MgSO <sub>4</sub> ·7H <sub>2</sub> O	246.48	2.0 ± 0.05
Potassium nitrate	KNO <sub>3</sub>	101.1	0.5 ± 0.05
Potassium phosphate	K <sub>2</sub> HPO <sub>4</sub> ·H <sub>2</sub> O	228.2	0.1 ± 0.05

7.7 Microorganisms shall be selected on the basis of ability to degrade various biodegradable polymers, starches, cellulose, and bacterial polyesters. **Table 2** shows the composition of the synthetic sea salt.

## 8. Hazards

8.1 All microorganisms present the possibility of disease and shall be handled with due caution. Hands shall be washed before and after exposure. Latex gloves and safety glasses shall be used along with a mouth cover. All spills containing organisms shall be cleaned with germicidal/antibacterial agents, and all old cultures shall be autoclaved before being discarded.

8.2 This test method requires the use of hazardous chemicals. Avoid contact with chemicals and follow the manufacturer's instructions and Material Safety Data Sheets.

8.3 All purchased media also can be hazardous. Read all safety instructions.

## 9. Inoculum Test Organisms

9.1 The inoculum consists of a minimum of nine test organisms. The microorganisms were identified by using bacterial identification test (that is, Biolog system, gram stains). Their identifications to at least genus are the following: *Ateromonas haloplanktis*, *Xanthomonas campestris*, *Vibrio alginolyticus*, *Vibrio proteolyticus*, *Actinomyces sp.*, *Bacillus megaterium*, *Bacillus sp.*, *Zooster sp.* and *Pseudomonas sp.* *Pseudomonas sp* has multiple species.
