Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Candidate Harmonized European Standard (Telecommunications series) has been produced by ETSI Technical Committee Electromagnetic compatibility and Radio spectrum Matters (ERM).

The present document has been produced by ETSI in response to a mandate from the European Commission issued under Council Directive 98/34/EC (as amended) laying down a procedure for the provision of information in the field of technical standards and regulations.

The present document is intended to become a Harmonized Standard, the reference of which will be published in the Official Journal of the European Communities referencing the Directive 1999/5/EC [1] of the European Parliament and of the Council of 9 March 1999 on radio equipment and telecommunications terminal equipment and the mutual recognition of their conformity ("the R&TTE Directive").

The present document is part 7 of a multi-part deliverable covering the Base Stations (BS), Repeaters and User Equipment (UE) for IMT-2000 Third-Generation cellular networks, as identified below:

[SIST EN 301 908-7 V2.2.1:2004](#)

iTeh STANDARD PREVIEW (standards.iteh.ai)

[SIST EN 301 908-7 V2.2.1:2004](#)
<https://standards.iteh.ai/catalog/standards/sist/917e42c9-9b6c-4a54-af66-ba3dfa524b58/sist-en-301-908-7-v2-2-1-2004>

Introduction

The present document is part of a set of standards designed to fit in a modular structure to cover all radio and telecommunications terminal equipment under the R&TTE Directive [1]. Each standard is a module in the structure. The modular structure is shown in figure 1.

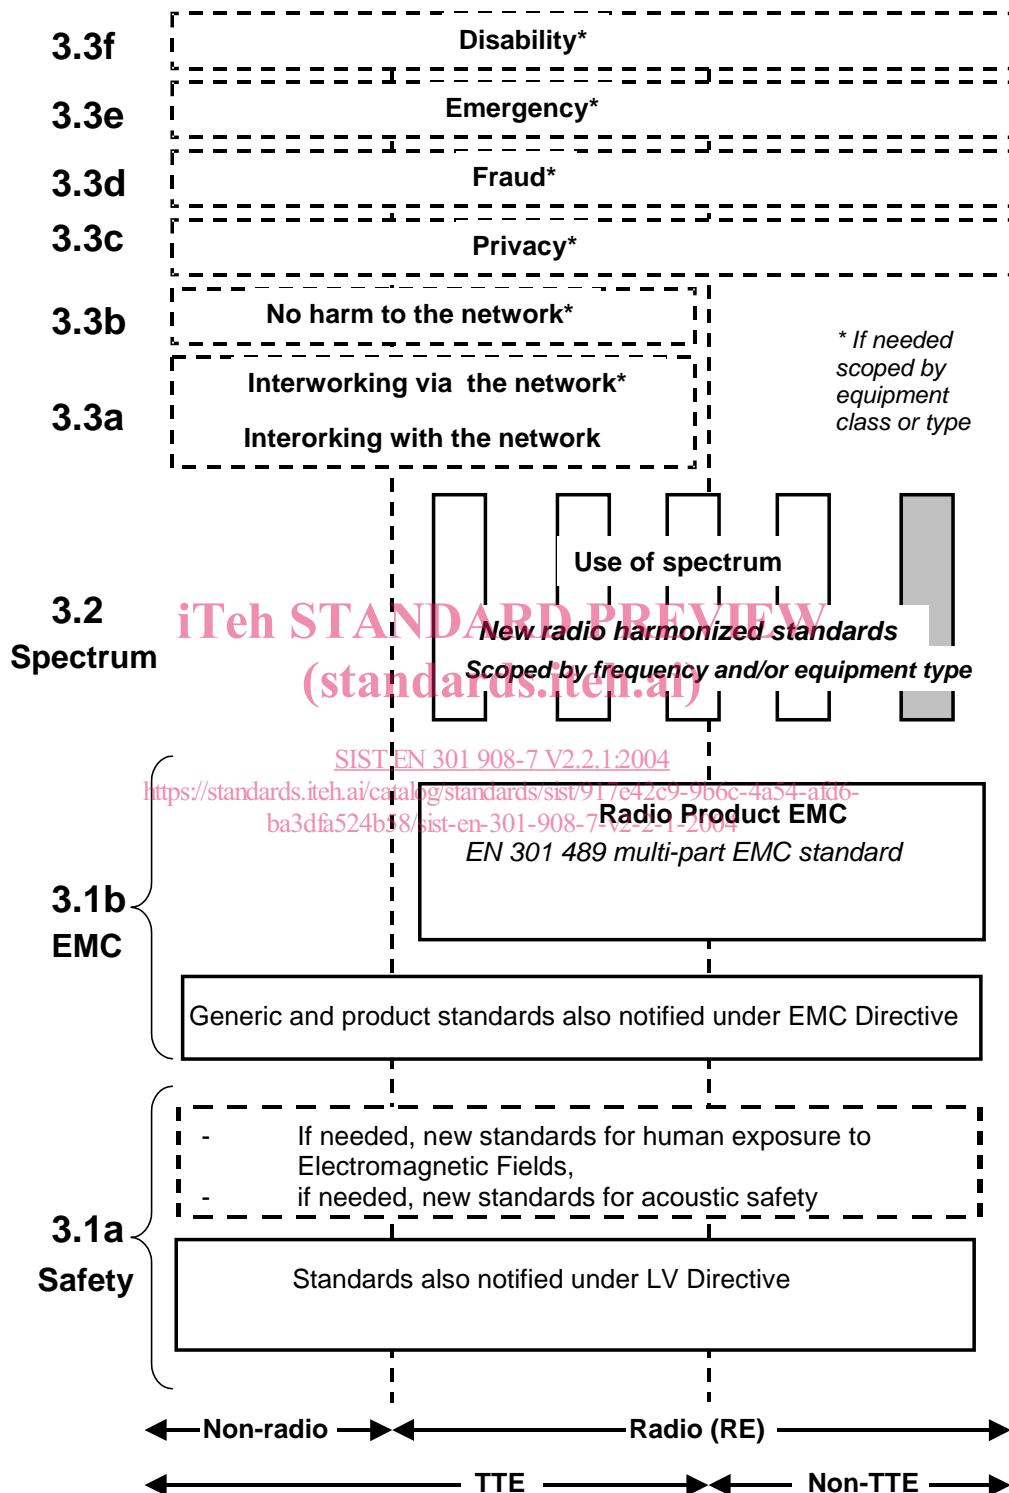

Figure 1: Modular structure for the various standards used under the R&TTE Directive

The left hand edge of figure 1 shows the different clauses of article 3 of the R&TTE Directive [1].

For article 3.3 various horizontal boxes are shown. Dotted lines indicate that at the time of publication of the present document essential requirements in these areas have to be adopted by the Commission. If such essential requirements are adopted, and as far and as long as they are applicable, they will justify individual standards whose scope is likely to be specified by function or interface type.

The vertical boxes show the standards under article 3.2 for the use of the radio spectrum by radio equipment. The scopes of these standards are specified either by frequency (normally in the case where frequency bands are harmonized) or by radio equipment type.

For article 3.1b figure 1 shows EN 301 489 [8], the multi-part product EMC standard for radio used under the EMC Directive [2].

For article 3.1a figure 1 shows the existing safety standards currently used under the LV Directive [3] and new standards covering human exposure to electromagnetic fields. New standards covering acoustic safety may also be required.

The bottom of figure 1 shows the relationship of the standards to radio equipment and telecommunications terminal equipment. Particular equipment may be radio equipment, telecommunications terminal equipment or both. A radio spectrum standard will apply if it is radio equipment. An article 3.3 standard will apply as well only if the relevant essential requirement under the R&TTE Directive [1] is adopted by the Commission and if the equipment in question is covered by the scope of the corresponding standard. Thus, depending on the nature of the equipment, the essential requirements under the R&TTE Directive [1] may be covered in a set of standards.

The modularity principle has been taken because:

- it minimizes the number of standards needed. Because equipment may, in fact, have multiple interfaces and functions it is not practicable to produce a single standard for each possible combination of functions that may occur in an equipment;
- it provides scope for standards to be added:
 - under article 3.2 when new frequency bands are agreed; or
<https://standards.iteh.ai/catalog/standards/sist/917e42c9-9b6c-4a54-af6>
 - under article 3.3 should the Commission take the necessary decisions without requiring alteration of standards that are already published;
- it clarifies, simplifies and promotes the usage of Harmonized Standards as the relevant means of conformity assessment.

The product specifications upon which all parts of EN 301 908 is based, differ in presentation; and this is reflected in the present document.

1 Scope

The present document applies to the following radio equipment type:

- Base stations for IMT-2000 CDMA TDD (UTRA TDD).

This radio equipment type is capable of operating in all or any part of the frequency bands given in table 1.

Table 1: CDMA TDD base station frequency bands

Direction of transmission	CDMA TDD base station frequency bands
Transmit and Receive	1 900 MHz to 1 920 MHz
Transmit and Receive	2 010 MHz to 2 025 MHz

The requirements in the present document apply to both Wide Area base stations and Local Area base stations unless otherwise stated.

IMT-2000 CDMA TDD (UTRA TDD) supports two options of the TDD mode with the chip rates of 3,84 Mchip/s and 1,28 Mchip/s. These two options are called the 3,84 Mcps TDD option and the 1,28 Mchip/s TDD option respectively. The requirements are listed in different subsections only if the parameters deviate.

The present document covers requirements for 3,84 Mcps TDD option base station for Release 99, 4 and 5 and for 1,28 Mcps TDD option base stations for Release 4 and 5.

For general purpose base stations of Release 99 and 4 only the requirements for Wide Area base stations shall apply.

The present document is intended to cover the provisions of Directive 1999/5/EC (R&TTE Directive) article 3.2, which states that "[...] radio equipment shall be so constructed that it effectively uses the spectrum allocated to terrestrial/space radio communications and orbital resources so as to avoid harmful interference".

In addition to the present document, other ENs that specify technical requirements in respect of essential requirements under other parts of article 3 of the R&TTE Directive [1] will apply to equipment within the scope of the present document.

<https://standards.iteh.ai/catalog/standards/sist/917e42c9-9b6c-4a54-af66-ba3dfa524b58/sist-en-301-908-7-v2-2-1-2004>

NOTE: A list of such ENs is included on the web site: <http://www.newapproach.org/>.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in the R&TTE Directive [1] and the following apply:

iTeh STANDARD PREVIEW

ancillary RF amplifier: piece of equipment, which when connected by RF coaxial cables to the BS, has the primary function to provide amplification between the transmit and/or receive antenna connector of a BS and an antenna without requiring any control signal to fulfil its amplifying function

environmental profile: range of environmental conditions under which equipment within the scope of the present document is required to comply with the provisions of the present document
<https://standards.iteh.eu/catalog/standards/sist/en/301-908-7-v2-2-1-2004>

local area base station: base station, characterized by requirements derived from Pico Cell scenarios with a BS to UE coupling loss equals to 45 dB

maximum output power (P_{max}): mean power level per carrier of the base station measured at the antenna connector in a specified reference condition

NOTE: The period of measurement shall be a transmit timeslot excluding the guard period.

mean power: when applied to a CDMA modulated signal this is the power (transmitted or received) in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode

NOTE: The period of measurement shall be a transmit timeslot excluding the guard period unless otherwise stated.

output power: mean power of one carrier of the base station, delivered to a load with resistance equal to the nominal load impedance of the transmitter

Rated Output Power (PRAT): mean power level per carrier that the manufacturer has declared to be available at the antenna connector

RRC filtered mean power: mean power as measured through a root raised cosine filter with roll-off factor α and a bandwidth equal to the chip rate of the radio access mode

wide area base stations: base station, characterized by requirements derived from macrocell and microcell scenarios with BS to UE coupling losses equal to 70 dB and 53 dB

3.2 Symbols

For the purposes of the present document, the following symbols apply:

α	roll-off factor, $\alpha = 0,22$
$\frac{DPCH_o - E_c}{I_{or}}$	The ratio of the average transmits energy per PN chip for the $DPCH_o$ to the total transmit power spectral density in one time slot.

3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

16QAM	16 - Quadrature Amplitude Modulation
3GPP	3rd Generation Partnership Project
ACLR	Adjacent Channel Leakage power Ratio
ACS	Adjacent Channel Selectivity
B	appropriate frequency in the Bottom of the operating frequency band of the BS: "RF channel"
BER	Bit Error Ratio
BS	Base Station
BTS	Base Transceiver Station
CDMA	Code Division Multiple Access
CW	Continuous Wave (unmodulated signal)
dB	decibel
dBm	decibel relative to 1 milliwatt
DL	Down Link (forward link)
$DPCH_o$	A mechanism used to simulate an individual intracell interferer in the cell with one code and a spreading factor of 16 <i>(New STANDARD PREVIEW standards.iteh.ai)</i>
EMC	ElectroMagnetic Compatibility
EUT	Equipment Under Test
F	Frequency (of the assigned channel frequency of the wanted signal)
FDD	Frequency Division Duplexing
F_{uw}	Frequency offset of the unwanted interfering signal from the assigned channel frequency of the wanted signal
HS-PDSCH	High Speed Physical Downlink Shared Channel
IMT-2000	International Mobile Telecommunications 2000
LV	Low Voltage
M	appropriate frequency in the Middle of the operating frequency band of the BS: "RF channel"
MS	Mobile station
P	output Power
P_{max}	Maximum output power of the base station
PRAT	RATed Output Power of the base station
R&TTE	Radio equipment and Telecommunications Terminal Equipment
RMS	Root-Mean Square
RRC	Root-Raised Cosine
T	appropriate frequency in the Top of the operating frequency band of the BS: "RF channel"
TDD	Time Division Duplexing
TS	Time Slot
TTE	Telecommunications Terminals Equipment
UE	User Equipment
UL	Up Link (reverse link)
UTRA	Universal Terrestrial Radio Access

4 Technical requirements specifications

4.1 Environmental profile

The technical requirements of the present document apply under the environmental profile for operation of the equipment, which shall be declared by the supplier. The equipment shall comply with all the technical requirements of the present document at all times when operating within the boundary limits of the required operational environmental profile.

For guidance on how a supplier can declare the environmental profile see annex C.

4.2 Conformance requirements

4.2.1 Introduction

To meet the essential requirement under article 3.2 of the R&TTE Directive [1] for IMT-2000 base stations (BS) seven essential parameters in addition to those in EN 301 908-1 [9] have been identified. Table 2 provides a cross reference between these seven essential parameters and the corresponding nine technical requirements for equipment within the scope of the present document.

To fulfil an essential parameter the compliance with all the corresponding technical requirements in table 2 must be verified.

iTeh STANDARD PREVIEW

Table 2: Cross references
SISTEN 301 908-7 V2.2.1

Essential parameter (standards detail)	Corresponding technical requirements
Spectrum emissions mask	4.2.2 Spectrum emission mask
	4.2.3 Transmitter Adjacent Channel Leakage power Ratio (ACLR)
Conducted spurious emissions from the transmitter antenna connector	4.2.4 Transmitter spurious emissions
Accuracy of maximum output power	4.2.5 Base station maximum output power
Intermodulation attenuation of the transmitter	4.2.6 Transmit intermodulation
Conducted spurious emissions from the receiver antenna connector	4.2.7 Receiver spurious emissions
Impact of interference on receiver performance	4.2.8 Receiver blocking characteristics 4.2.9 Receiver intermodulation characteristics
Receiver adjacent channel selectivity	4.2.10 Receiver Adjacent Channel Selectivity (ACS)

The technical requirements also apply to the BS configurations described in annex B.

4.2.2 Spectrum emission mask

4.2.2.1 Definition

Spectrum emission mask defines an out of band emission requirement for the base station transmitter. These out of band emissions are unwanted emissions outside the channel bandwidth resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions.

4.2.2.1.1 3,84 Mcps TDD option

The spectrum emission mask specifies the limit of the transmitter out of band emissions at frequency offsets from the assigned channel frequency of the wanted signal between 2,5 MHz and 12,5 MHz.
