### About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

### About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

- Catalogue of IEC publications: [www.iec.ch/searchpub](http://www.iec.ch/searchpub)

The IEC on-line Catalogue enables you to search by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, withdrawn and replaced publications.

- IEC Just Published: [www.iec.ch/online\\_news/justpub](http://www.iec.ch/online_news/justpub)

Stay up to date on all new IEC publications. Just Published details twice a month all new publications released. Available on-line and also by email.

[IEC 62463:2010](#)

- Electropedia: [www.electropedia.org](http://www.electropedia.org)

The world's leading online dictionary of electronic and electrical terms containing more than 20 000 terms and definitions in English and French, with equivalent terms in additional languages. Also known as the International Electrotechnical Vocabulary online.

- Customer Service Centre: [www.iec.ch/webstore/custserv](http://www.iec.ch/webstore/custserv)

### A propos de la CEI

La Commission Electrotechnique Internationale (CEI) est la première organisation mondiale qui élabore et publie des normes internationales pour tout ce qui a trait à l'électricité, à l'électronique et aux technologies apparentées.

### A propos des publications CEI

Le contenu technique des publications de la CEI est constamment revu. Veuillez vous assurer que vous possédez l'édition la plus récente, un corrigendum ou amendement peut avoir été publié.

- Catalogue des publications de la CEI: [www.iec.ch/searchpub/cur\\_fut-f.htm](http://www.iec.ch/searchpub/cur_fut-f.htm)

Le Catalogue en-ligne de la CEI vous permet d'effectuer des recherches en utilisant différents critères (numéro de référence, texte, comité d'études,...). Il donne aussi des informations sur les projets et les publications retirées ou remplacées.

- Just Published CEI: [www.iec.ch/online\\_news/justpub](http://www.iec.ch/online_news/justpub)

Restez informé sur les nouvelles publications de la CEI. Just Published détaille deux fois par mois les nouvelles publications parues. Disponible en-ligne et aussi par email.

- Electropedia: [www.electropedia.org](http://www.electropedia.org)

Le premier dictionnaire en ligne au monde de termes électroniques et électriques. Il contient plus de 20 000 termes et définitions en anglais et en français, ainsi que les termes équivalents dans les langues additionnelles. Egalement appelé Vocabulaire Electrotechnique International en ligne.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**RADIATION PROTECTION INSTRUMENTATION –  
X-RAY SYSTEMS FOR THE SCREENING OF PERSONS  
FOR SECURITY AND THE CARRYING OF ILLICIT ITEMS**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62463 has been prepared by subcommittee 45B: Radiation protection instrumentation, of IEC technical committee 45: Nuclear instrumentation.

The text of this standard is based on the following documents:

FDIS	Report on voting
45B/642/FDIS	45B/658/RVD

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC web site under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

## **iTeh STANDARD PREVIEW (standards.iteh.ai)**

[IEC 62463:2010](#)

## INTRODUCTION

The existence of this standard does not indicate approval of the use of the relevant equipments. However these equipments exist and are used in some countries and are likely to be used to scan persons of all nationalities including nationals of those countries which ban their use. If other international organisations ban their use, this standard could be withdrawn. Meanwhile it is considered valuable to have this standard to reduce the radiation doses to members of the public and others likely to have to use the equipments. Personnel X-ray screening assemblies are used to examine persons in order to detect objects such as: weapons, explosives, smuggled or stolen items such as drugs or diamonds. The screening devices can be divided into three types: one type using the Compton backscattered X-rays (Backscatter system) for the image creation, one using the transmitted X-rays (Transmission system) for the image creation, and a third type as a combination of the two types (Backscatter + Transmission).

All three types consist of an X-ray unit and a detector unit, and take about 10 s to perform a scan.

The systems are operated by and the image is viewed on an external computer. Sophisticated software is used to evaluate the complex images and to enable the detection of hidden objects.

The main difference between the system types is the position of the detectors. Usually, they also differ in the tube voltage range used.

Backscatter X-ray systems, (B), use a narrow pencil shaped beam that scans the subject at high speed in a horizontal and vertical direction. Large detectors are installed on the same side of the subject as the X-ray source. The person stands in front of the enclosure and is scanned by the X-ray beam having a typical cross-sectional area of approximately 25 mm<sup>2</sup>; this of course is the quantity limiting the spatial resolution of the system. Usually the person is scanned twice, once from the front and then from the back. Sometimes lateral scans are also performed. Typical systems use fixed peak voltage (kV) and current (mA) settings for the X-ray source. These are typically 50 kV and 5 mA. The total aluminium equivalent filtration is in the range of 1 mm to 7 mm.

Transmission X-ray systems, (T), often use a vertical fan-shaped beam of X-rays and a linear array of detectors. The person stands between the X-ray tube and the detector array and is scanned by the X-ray beam having a typical width of approximately 2 mm. The limiting quantity for the spatial resolution is the size of the detector elements. Typical systems use a fixed peak voltage (kV) and current (mA). Settings are in the range of about 140 kV to 220 kV and 0,1 mA to about 4 mA. The total aluminium equivalent thickness is in the range of about 1 mm to about 16 mm. The systems are capable of detecting objects within the body.

Backscatter plus transmission X-ray systems, (BT), are systems that use both backscattered and transmitted X-rays, during the same scan procedure.

# RADIATION PROTECTION INSTRUMENTATION – X-RAY SYSTEMS FOR THE SCREENING OF PERSONS FOR SECURITY AND THE CARRYING OF ILLICIT ITEMS

## 1 Scope and object

This International Standard is applicable to X-ray systems designed for screening people to detect if they are carrying objects that could be used for criminal purposes, e.g., terrorist use, drug smuggling and theft. These objects include weapons, explosives, chemical and biological agents and other concealed items.

Three types of X-ray screening systems are currently in use. These are backscatter systems, transmission systems and combination backscatter/transmission systems. With backscatter systems the X-rays are used to detect objects hidden under or within the person's clothing. With transmission systems objects swallowed or hidden in body cavities may be detected. Combined devices can be used to get both pieces of information simultaneously.

The object of this standard is to lay down standard requirements and also to specify general characteristics, general test procedures, radiation characteristics, electrical characteristics, environmental influences, mechanical characteristics, safety requirements and to provide examples of acceptable methods in terms of dose to the whole or part of the body for each screening procedure and the time taken for each screening procedure.

In particular the standard addresses the design requirements as they relate to the radiation protection of the people being screened, people who are in the vicinity of the equipment and the operators. The standard does not address the performance requirements for the quality of the object detection.

## 2 Normative references

iTeh STANDARD PREVIEW

### 3 Terms and definitions (standards.iteh.ai)

For the purposes of this document, the following terms and definitions apply. The general terminology concerning X-ray screening systems is given in IEC 60050-393:2003 and IEC 60050-394:2007.

#### 3.1

##### **ambient dose equivalent, $H_x(d)$**

the ambient dose equivalent at a point in a radiation field, is the dose equivalent that would be produced by the corresponding expanded and aligned field, in the ICRU sphere at a depth,  $d$ , on the radius opposing the direction of the aligned field

[ICRU 51]

NOTE 1 The recommended depth,  $d$ , for strongly penetrating radiation is 10 mm, and ambient dose equivalent at this depth may be written as  $H_x(10)$ .

NOTE 2 Soft tissue means ICRU 4-element, see ICRU 39.

#### 3.2

##### **constant potential X-ray unit**

unit in which the ripple of the high voltage does not exceed  $\pm 10\%$

#### 3.3

##### **exposure beam location**

that part of the external surface of the system enclosure through which the collimated X-ray beam passes

#### 3.4

##### **half value layer (air kerma), HVL or HVL<sub>x</sub>**

the thickness of the specified material which attenuates the beam of radiation to an extent such that the air kerma rate is reduced to one half of its original value. In this definition, the contribution of all scattered radiation, other than any which might be present initially in the beam concerned, is deemed to be excluded.

[ICRU 17]

### 3.5

#### **filtration**

the total filtration is made up of the fixed filtration and any additional filtration used by the manufacturer.

The fixed filtration comprises the inherent filtration of the tube, plus that due to the monitor ionisation chamber.

The inherent filtration of the tube is due to the various constituent elements (glass of the bulb, oil, window, etc.) and is expressed, for a given high voltage, as the thickness of an aluminium filter which, in the absence of the constituent elements of the tube, would supply a radiation having the same first HVL.

### 3.6

#### **monitor instrument**

instrument with an alarm used to monitor the stability of the ambient dose equivalent rate during an irradiation or to compare the ambient dose equivalent rate during a screening with the reference dose equivalent rate determined during the type testing

### 3.7

#### **mode of operation**

backscatter, transmission or backscatter and transmission system and scanning technique

### 3.8

#### **operator**

person authorised and fully trained to operate the system

### 3.9

#### **reference instrument**

instrument whose calibration is traceable either directly or indirectly to primary standards held by a national primary laboratory or to an acknowledged reference laboratory which holds appropriate standards

### 3.10

#### **reference point**

the point within the space that may be occupied by the person being screened receiving the maximum dose and at which for the purpose of the testing requirements of this standard the X-ray spectra (or HVL) and reference ambient dose equivalent per screening procedure is measured

### 3.11

#### **safety interlocks**

devices which are intended to prevent or interrupt the generation of X-radiation whenever safety is compromised by access to the interior of the system, operational irregularity or equipment failure

### 3.12

#### **scan**

the scanning cycle consisting of the operation necessary to produce one view (e.g., front view)

### 3.13

#### **scanning system**

the whole equipment used to produce a scan, including the X-ray generator and collimator

### 3.14

#### **screening procedure**

the sum of all scans necessary to examine one person

**3.15**  
**enclosure**

the containment within which the X-ray unit and its scanning system are enclosed

**3.16**  
**ripple**

ratio, expressed as a percentage, defined for a given current by the formula:

$$(U_{\max} - U_{\min}) \times 100 / U_{\max}$$

where  $U_{\max}$  is the maximum value and  $U_{\min}$  the minimum value of the voltage.

**3.17**  
**user**

the person being screened by the equipment

**3.18**  
**X-ray unit**

assembly comprising a high voltage supply, an X-ray tube with its protective housing, and high voltage electrical connections

**3.19**  
**X-ray tube**

vacuum tube designed to produce X-rays by bombardment of the anode by a beam of electrons accelerated through a potential difference

**4 Units**

[IEC 62463:2010](https://standards.iteh.ai/catalog/standards/sist/b0ef8948-7e41-4319-b166-c85ca2894f2/iec-62463-2010)

In this standard, the units are the multiples and sub-multiples of units of the International System of Units (SI)<sup>1</sup>. The following non-SI units are also used:

Time: years, days, hours (h), minutes (min).

For energy: electron-volt (eV), (1 eV = 1,602 × 10<sup>-19</sup> J).

NOTE Definitions of the radiation quantities and dosimetric terms are given in IEC 60050-393 and IEC 60050-394.

**5 Classification of systems**

Systems are classified according to whether they are backscatter X-ray systems, (B) or transmission X-ray systems, (T), or combined backscatter and transmission systems, (BT).

**6 General test procedures**

**6.1 Nature of tests**

Unless otherwise specified in the individual subclauses, all tests enumerated in this standard are to be considered as “type tests”.

<sup>1</sup> (SI International Bureau of Weights and Measures: The International System of Units, 8<sup>th</sup> edition 2006).

## 6.2 Reference conditions and standard test conditions

Reference and standard test conditions are given in Table 1. Reference conditions are those conditions to which the performance of the instrument is referred and standard test conditions indicate the necessary tolerances in practical testing. Except where otherwise specified, the tests in this standard shall be performed under the standard test conditions given in the third column of Table 1.

## 6.3 Tests performed under standard test conditions

Tests performed under standard test conditions are listed in Table 2, which indicates, for each characteristic under test, requirements according to the subclause where the corresponding test method is described.

## 6.4 Tests performed with variation of influence quantities

For those tests intended to determine the effects of variations in the influence quantities given in Table 3, all other influence quantities shall be maintained within the limits for the standard test conditions given in Table 1 unless otherwise specified in the test procedure concerned.

# 7 Safety considerations

## 7.1 General

The manufacturer shall provide a description of the radiation safety systems that are designed to prevent, during normal operation of the X-ray screening system, accidental exposure to the operator and public and for ensuring that the person being screened is not exposed above manufacturers stated maximum dose per screening procedure (see Clause 9). The accompanying manual provided by the manufacturer shall include details of the fail-safe features of the radiation safety exposure circuit. These details shall also include functional test instructions.

The manufacturer shall reference the radiological and electrical safety considerations used for the system by quoting applicable IEC and ISO publications, see 7.4.1.

## 7.2 Shielding

### 7.2.1 Requirements

When a person is being screened and the X-ray beam is emanating, shutter or beam stop open, the ambient dose equivalent rate to any area where other members of the public or the operator have access should not exceed  $2,5 \mu\text{Sv}\cdot\text{h}^{-1}$  taken over several scans. Where the dose rate could exceed this value at a distance in excess of 30 cm from any external surface the manufacturer shall provide an isodose contour at this value. National regulations may stipulate lower limits.

### 7.2.2 Method of test

The direction in which the highest dose per screening procedure is emitted shall be identified by measurement. (Technical drawings and further physical aspects may assist in determining this but should not be relied upon.) Careful consideration should be given to control stations, fissures around doors, ventilation openings, shielding joints and any other vulnerable areas based on technical drawings. If there are outer doors or removable panels that are not locked or interlocked, the radiation survey shall be repeated with the doors open and panels removed. At the distance specified in 7.2.1, from the surface of the device the ambient dose equivalent per screening procedure (that means the sum of all scans necessary to examine a person) shall be measured. The X-ray scanner shall be operated in the mode with the greatest high voltage, greatest tube current and the smallest total filtration allowed to be used in operation. This shall be done for at least five subsequent screening procedures following each other as fast as the device is able to perform. The total dose over all these screening

procedures shall be divided by the time all these screening procedures took. This value plus the overall uncertainty ( $k = 2$ ) shall not exceed the ambient dose equivalent rate requirement listed in 7.2.1.

This dose equivalent rate shall be determined by a reference instrument having a response that is within 20 % of the true value over the energy range from 25 keV to the maximum energy in keV corresponding to the maximum operating voltage of the X-ray tube.

### 7.3 System controls and normal operation indications

#### 7.3.1 Requirements

The operating conditions, namely the tube voltage and tube current, for each mode of operation shall be pre-set by the manufacturer and shall not be alterable by the system operator. If there is more than one mode, prior to each scan a mode indicator shall be clearly visible to the operator.

The operators control panel shall show the following:

- Electrical power to the system is on. Only the operator is permitted to switch on the power and this should require the use of a key.
- When the X-rays are being produced an “X-rays on” illuminated sign shall operate.
- The voltage and current for the operating mode shall be displayed when required by an engineer or maintenance staff.
- Indication shall be made for both when the shutter or beam stop is open and/or for when the scan is taking place, “scan on”
- The production of x-rays shall only start if the illuminated sign “X-rays” is ready to operate.

Sufficient diagnostics shall be designed into the system to facilitate fault finding and to provide local and remote information on the status of the system. A self-test device shall be provided to perform self-testing continuously. Operation of the equipment after fault detection must be prevented until the fault is cleared. The manufacturer shall produce a test plan which shall demonstrate the normal operation of the system. This test plan shall contain all normal operational features, diagnostics, self-test facilities and safety features of the system.

If the moveable parts, e.g., the platform, X-ray unit or chopper, do not work properly the system shall shut down automatically.

#### 7.3.2 Method of test

Using the manufacturer's test plan verify that the operator's control panel displays the information as required in 7.3.1.

Testing is done automatically by the software and related electronics. Interlocks, indications and alarms shall be independent of the system's normal controls and operation indicators.

### 7.4 Safety indicators and interlocks

#### 7.4.1 Safety standards

Appropriate requirements shall apply concerning specification, design, manufacturing, installation and operation of the equipment, with respect to the necessary hardware and software. The requirements shall be agreed between manufacturer and purchaser. In particular the purchaser (operator) shall decide the appropriate safety standard applicable to the site in which the system will be placed. The basic safety standard IEC 61508 Functional Safety of Electrical/ Electronic/Programmable electronic systems shall apply, as appropriate according to the required Safety Integrity Level (SIL) specified for the system.

### 7.4.2 Requirements

Operational interlocks shall terminate the production of X-rays in the event of any operational problem that could result in abnormal or unintended radiation emission. Either through redundancy or special design, a malfunction of any operational interlock or any system monitoring an operational interlock shall also terminate X-ray production regardless of the actual radiation emission. This shall include, but is not limited to: unintended stopping or slowing of the scanning motion, abnormal or unintended X-ray source output, computer safety system malfunction, termination malfunction, and when applicable, X-ray shutter or beam stop mechanism malfunction.

### 7.4.3 Method of test

The manufacturer shall produce a test plan in accordance with IEC 61508 which shall demonstrate the operation of the safety alarms and interlocks for the SIL level specified.

The system shall be switched on and allowed to run its start up and self-test routines. A fault condition in each one of the monitored parameters shall be simulated and the warning or fault description recorded.

## 8 Conditions and methods for producing the X-ray screening spectra

### 8.1 General

In practice the spectra of the radiation produced depends primarily on:

- the high-voltage across the X-ray tube;
- the thickness and nature of the total filtration;
- the type and nature of the target.

### 8.2 Tube potential characteristics of the X-ray unit

#### 8.2.1 Requirements

The conventionally true value of the potential shall be known to within  $\pm 5$  %.

#### 8.2.2 Method of test

Calibrate, at several points close to their stated operating tube potential, and under normal operating conditions, the equipment used to indicate the tube potential. The best methods employ a calibrated resistor chain or involve the measurement of the maximum photon energy by spectrometry. If the calibration is determined by spectrometry, the tube potential shall be found from the intersection of the extrapolated linear high energy part of the spectrum with the energy axis. Advice on methods of accomplishing this are described in ISO 4037-1.

## 9 Ambient dose equivalent at the position of the person being screened

### 9.1 Requirements

The ambient dose equivalent,  $H_x(10)$ , at the reference point shall not exceed  $0,4 \mu\text{Sv}$  per screening procedure (that means the sum of all scans necessary to examine a person) for backscatter systems, (B) and  $5 \mu\text{Sv}$  per screening procedure (that means the sum of all scans necessary to examine a person) for transmission systems (T) and backscatter and transmission systems, (BT). Other values may be specified as required by national regulations.
