Heizkessel - Teil 1: Heizkessel mit Gebläsebrenner - Begriffe, allgemeine Anforderungen, Prüfung und Kennzeichnung

This European Standard was approved by CEN on 21 August 1998.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Central Secretariat has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

## Foreword

This European Standard has been prepared by Technical Committee CEN/TC 57 "Central heating boilers", the secretariat of which is held by DIN.

This European Standard supersedes EN 303-1:1992.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by July 1999, and conflicting national standards shall be withdrawn at the latest by July 1999.

The following structure is intended for the European standards for heating boilers:

### prEN 303-1

Heating boilers – Part 1: Heating boilers with forced draught burners – Terminology, general requirements, testing and marking

### prEN 303-2

Heating boilers – Part 2: Heating boilers with forced draught burners – Special requirements for boilers with atomizing oil burners

### prEN 303-3

Heating boilers – Part 3: Gas fired central heating boilers – Assembly comprising a boiler body and a forced draught burner

### prEN 303-4

Heating boilers – Part 4: Heating boilers with forced draught burners – Special requirements for boilers with forced draught oil burners with outputs up to 70 kW and a maximum operating pressure of 3 bar – Terminology, special requirements, testing and marking

### prEN 303-5

Heating boilers – Part 5: Heating boilers for solid fuels, hand and automatically fired, with a nominal heat output of up to 300 kW – Terminology, requirements, testing and marking

### EN 304

Heating boilers – Test code for heating boilers for atomizing oil burners

Concerning the required extension of the heat output from 300 kW up to 1000 kW the following essential changes were agreed:

- a) modification of clause 1;
- b) amendments of table 3 and table 7;
- c) amendment in 4.1.5.8 "burner matching dimensions";
- d) revision of table 1 .

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom.

**ITEH STANDARD PREVIEW**  
**(standards.iteh.ai)**

[SIST EN 303-1:1999](https://standards.iteh.ai/catalog/standards/sist/35afeda0-7e37-4a02-852c-de0055c8fc48/sist-en-303-1-1999)

<https://standards.iteh.ai/catalog/standards/sist/35afeda0-7e37-4a02-852c-de0055c8fc48/sist-en-303-1-1999>

## 1 Scope

This standard is applicable to heating boilers with burners using fans up to a nominal heat output of 1000 kW. They are operated, either with negative pressure (natural draught boiler) or with positive pressure (pressurised boiler) in the combustion chamber, in accordance with the boiler manufacturer's instructions.

This standard specifies the necessary terminology, the requirements on the materials and testing of them, and marking requirements for heating boilers.

Particular requirements for boilers which can be used with open vented systems are contained in prEN 303-4.

The requirements of this standard apply to heating boilers which are tested on an authorised test rig.

Boilers in accordance with this standard are designed for the heating of central heating installations in which the heat carrier is water, and the maximum allowable operating temperature of which is restricted to 100 °C. The maximum allowable operating pressure is 8 bar. For boilers with a built-in or attached water heater (storage or continuous flow heater) this standard only applies to the parts of the water heater which are necessarily subject to the operating conditions of the heating boiler (heating part).

This standard does not apply to gas boilers with atmospheric burners, boilers for solid fuels, oil or gas fired condensation boilers, boilers with oil vaporisation burners and low temperature boilers. For these boilers there are further requirements.

**NOTE:** Low temperature boilers are those operating with a (water) variable temperature up to 40 °C or less, or those which cannot be set at a temperature higher than 55 °C.

## 2 Normative references

This European Standard incorporates by dated or undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of any of these publications apply to this European Standard only when incorporated in it by amendment or revision. For undated references the latest edition of the publication referred to applies.

Metallic flanges - Part 3: Copper alloy and composite flanges

### 3 Definitions

For the purposes of this standard, the following definitions apply.

**3.1 operating pressure:** the maximum allowable pressure at which the boiler is to be normally operated. The operating pressure is less than the test pressure and the type test pressure.

**3.2 test pressure:** pressure to which all boilers and their parts are subjected during production in the works of the manufacturer or during setting up by the installer.

**3.3 type test pressure:** pressure to which the pre-production heating boiler(s) and associated parts are subjected before start of mass production in the manufacturing works.

**3.4 operating temperature:** the maximum allowable temperature at which the boiler can be operated under normal operating conditions at the maximum setting of the boiler's water temperature controller.

**3.5 heat output  $Q$ , heat output range:** is the amount of heat transferred to the heat carrier (water) per unit of time.

The heat output range is the span of output below the nominal heat output specified by the manufacturer over which the boiler meets the requirements of this standard and over which it can be used.

**3.6 nominal heat output  $Q_N$ :** is the continuous output specified by the manufacturer in accordance with the requirements of this standard. It is the maximum useful quantity of heat transferred to the heat carrier per hour.

**3.7 heat input  $Q_B$ :** is the amount of heat in unit time which is supplied to the furnace of the heating boiler by the fuel based on its net calorific value  $H_f$ .

**3.8 boiler efficiency  $\eta_K$ :** is the ratio of the heat output ( $Q$ ) to the heat input ( $Q_B$ ) supplied by the fuel.

$$\eta_K = \frac{Q}{Q_B}$$

**3.9 draught:** is the pressure differential between the static air pressure in the place of installation and the static pressure of the exhaust gases, as measured in the exhaust gas measuring section, which is required for correct operation of the boiler at nominal output.

**3.10 gas side resistance:** is the pressure differential between the combustion chamber and the boiler exit.

**3.11 soundness of combustion system:** is the soundness of the combustion circuit through which the exhaust gases flow.

**3.12 exit flue temperature  $t_A$ :** is the temperature measured at the flue exit of the boiler.

**3.13 flue gas loss:** is the quantity of heat per unit time which leaves the flue gas exit of the boiler unused.

**3.14 combustion circuit:** comprises the combustion chamber, the heat exchanger, the air supply circuit and the combustion product circuit up to the flue exit.

**3.15 standby loss  $q_B$ :** is the quantity of heat which is necessary to maintain the boiler at a given temperature when no heat output is used. It is stated as  $q_B$  in relation to the heat input  $Q_B$ .

**3.16 water side resistance:** is the pressure loss across the boiler measured at the flow and return connections of the boiler, with a volume flow corresponding to the nominal heat output.

**3.17 control thermostat:** a device enabling the water temperature to be kept automatically, within a given range, at a predetermined value.

**3.18 safety temperature limiter:** a device that causes safety shutdown and non-volatile lockout so as to prevent the water temperature exceeding a present limit.

STANDARD PREVIEW  
(standards.iteh.ai)

## 4 Requirements

### 4.1 Construction requirements

SIST EN 303-1:1999

<https://standards.iteh.ai/catalog/standards/sist/35afeda0-7e37-4a02-852c->

#### 4.1.1 General requirements

[de0055c8fc48/sist-en-303-1-1999](https://standards.iteh.ai/catalog/standards/sist/35afeda0-7e37-4a02-852c-de0055c8fc48/sist-en-303-1-1999)

Boilers shall be fire-resistant and safe to operate. They shall be made of non-combustible materials and shall be resistant to deformation and shall be such that:

- they can withstand the stresses arising during normal operation;
- the burner and the boiler cannot become heated to create a hazard;
- dangerous accumulations of combustible gases (fuels mixed with air) in the combustion chamber and in the flues are prevented and
- gases cannot leak from the boiler in dangerous quantities.

Combustible materials are allowable for

- components of accessories e. g. burner covers, if the parts are fitted outside of the boiler;
- internal components of controls and safety equipment;
- operating handles;
- electrical equipment;
- thermal insulation (see 4.1.5.9); only asbestos-free materials are allowable.

Component parts of covers, operating, control and safety devices and electrical accessories shall be arranged in such a way that their surface temperatures, under steady state conditions, do not exceed those specified either by the manufacturer or in the component part standard.

The materials for the parts subject to pressure shall be in accordance with generally accepted technical requirements. They shall be suitable for the purpose and treatment intended. The mechanical and physical properties as well as the chemical composition of the materials shall be guaranteed by the relevant material producer/supplier.

#### 4.1.2 Production documentation

##### 4.1.2.1 Drawings

The following shall be specified in the boiler drawings or in the relevant documents:

- the specified materials;
- the welding process, the weld type (generally the symbol for the weld type is sufficient) and the welding fillers;
- the maximum allowable operating temperature in °C;
- the maximum allowable operating pressure in bar;
- the test pressure in bar;
- the nominal heat output or the heat output range for every boiler size in kW.

##### 4.1.2.2 Manufacturing controls

Manufacturing control shall be carried out.

#### 4.1.3 Heating boilers of steel and of non-ferrous materials

##### 4.1.3.1 Execution of welding work

Boiler manufacturers who carry out welding work shall meet the following requirements of EN 287-1 and EN 287-2:

- only welders who are qualified in the welding of the materials to be processed may be used;
- equipment shall be available to allow defect free welding to be carried out;
- supervision of the welding shall be carried out by staff qualified in welding (at least one supervisor shall be so qualified).

##### 4.1.3.2 Welded joints and welding fillers

The materials shall be suitable for welding. The materials in accordance with table 1 are suitable for welding and do not require additional heat treatment after welding.

The welded joints shall not show any cracks or bonding faults and shall be defect free over the whole cross-section for butt welds. One-sided fillet welds, and half Y-welds which have been welded through, shall be kept substantially free from bending stresses. Smoke tubes, inserted stays and similar components need not be counterwelded. Double fillet welds are only permissible when sufficiently cooled. Projections into the flue gas side in areas of high thermal stresses shall be avoided.

Corner welds, edge welds and similar welded connections which are subjected to high bending stresses during production and operation are to be avoided.

For welded longitudinal stay bars or stay tubes the shearing cross section of the fillet weld should be at least 1,25 times the required stay bar or stay tube cross sectional area.

See table 2 (dimensions in mm) for details on the welding joints mentioned. Welding fillers shall be suitable for the material being used.

The terms used in table 2 are in accordance with ISO 2553. The reference numbers of welding processes are in accordance with ISO 857 and EN 24063.

#### 4.1.3.3 Parts of steel subject to pressure

The steels listed in table 1 shall be used.

The specification of the materials shall be documented by a works certificate (see EN 10021). These certificates shall be obtained by the boiler manufacturer. This does not apply to small components, e. g. sockets up to DN 50, screws and nuts.
