6.2.2 Verification of the characteristics of the coupling/decoupling network

Replace the second paragraph by the following:

The waveform shall be verified at the common mode output of the coupling/decoupling network with all outputs tied together and a single 50 Ω termination as shown in Figure 14. In addition to verification of the waveform at the common mode output of the coupling/decoupling network, it is recommended that each individual output be checked to ensure that all outputs are functional."

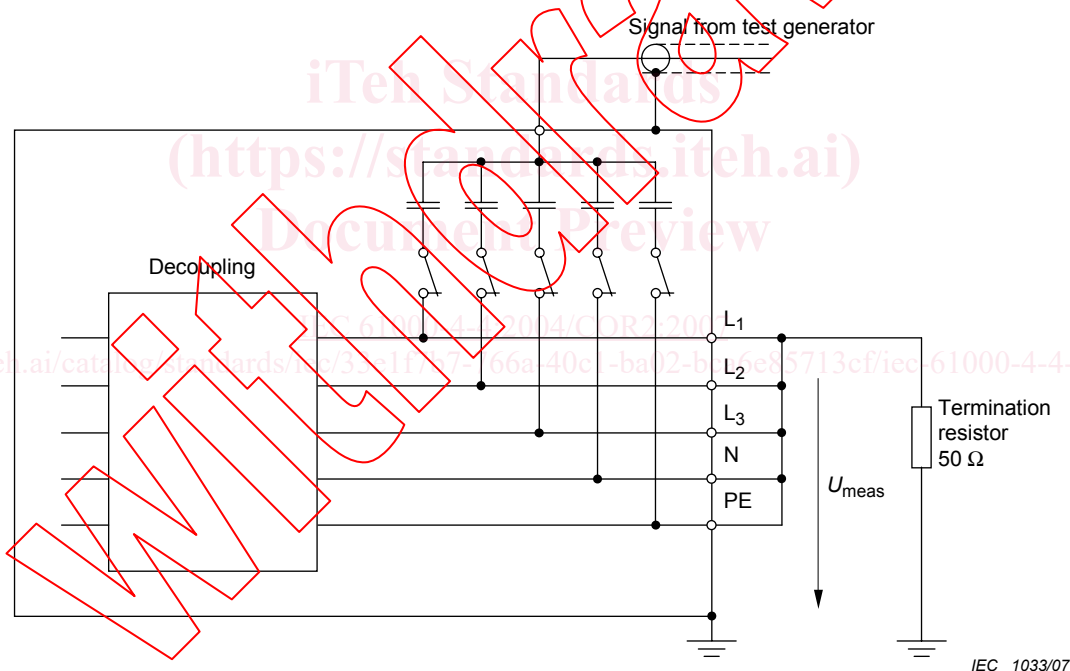

Figure 14 – Verification of the waveform at the common mode output of the coupling/decoupling network

Delete the 4th paragraph starting with "The functionality verification of ...".
