Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Introduction

System C is characterized by a series of nesting hole sizes providing small clearances between the hole wall and the equipment, making it possible to use thin-walled casing tubes. The equipment specified in this International Standard should be considered a separate system intended to be applied in parallel with system A (see ISO 3551) and system B (see ISO 3552): it is not interchangeable with these systems.

Rotary core diamond drilling equipment — System C

1 Scope

This International Standard specifies the material for and the dimensions of rotary core diamond drilling equipment, system C.

NOTE 1 Cutting materials other than diamond may be used.

It applies to

- single- and double-tube core barrels, including diamond core bits, reaming shells, core lifters, core-lifter cases, core tubes (outer and inner) and heads;
- drill rods and couplings;
- casing tubes and couplings.

The casing tubes are not designed for drilling, and the casing string is only employed for casing-off the hole.

The range of equipment covers diamond core drilling of holes from 35 mm to 112 mm in diameter (outer bit diameter) with the corresponding core diameters from 21 mm to 92 mm.

Single- and double-tube core barrels provide a means of coring compact rocks (types M and DM core barrels), fissured and fractured rocks (types T and DT core barrels) and fractured and broken-down rocks (type DP core barrels).

2 Designation

The designation of items complying with this International Standard comprises

- the name of the item;
- the letter(s) identifying the core barrel type (not applicable to drill rods and coupling, casing tubes and casing couplings);

- the nominal outside diameter of the item;
- the letter C (denoting system C).

EXAMPLES

Reaming shell DT59C

Drill rod 54C

3 Material

ISO 8866:1991 The equipment shall be manufactured from materials which, in the manufactured items, provide mechanical properties not less than those given in table 1.

Table 1 — Minimum mechanical properties of the material

Item	Tensile strength R_m	Yield stress R_e	Percentage elongation after fracture $5,65 \sqrt{S_0}$
	N/mm ² (MPa)	N/mm ² (MPa)	%
Drill rods (upset ends)	690	490	12
Drill rod coupling	765	590	14
Casing and core tubes, outside diameter ≤ 89 mm	690	490	12
Casing and core tubes, outside diameter > 89 mm	640	370	16
Other items	Not specified		

4 Dimensions and tolerances

The main dimensions of system C equipment are given in table 2. Other dimensions and tolerances are given in figure 3 to figure 44. Tube ovality should be kept within outer diameter tolerances.

The maximum deviation from straightness should not exceed

1:2 000 of the tube length, for drill rods and core tubes of outer diameter ≤ 73 mm

1:1 200 of the tube length, for casing tubes and core tubes of outer diameter > 73 mm

The curvature over 250 mm of each drill rod and core tube ends should not exceed 0,5 mm. See figure 1.

All dimensions are given in millimetres.

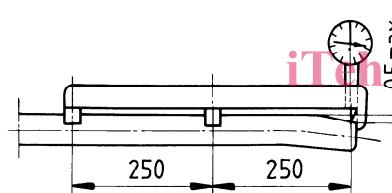

Figure 1 — Measuring tube end curvature <https://standards.iteh.ai/catalog/standards/iso/535b/0b6-41c6-4b98-b643-b1edf594dcf2/iso-8866-1991>
