Note d'introduction

Introductory note

IEC CO note: The document 17B/1359/MCR issued 2004-08-20 indicated that the revision of the TS to an IS would lead to Ed.2.0. This was an error.

The IS will be IEC 62091, Ed.1.0. The work programme has been modified accordingly.

## INTERNATIONAL ELECTROTECHNICAL COMMISSION

## LOW-VOLTAGE SWITCHGEAR AND CONTROLGEAR – CONTROLLERS FOR DRIVERS OF STATIONARY FIRE PUMPS

### FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with an IEC Publication.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62091 has been prepared by subcommittee 17B: Low-voltage switchgear and controlgear, of IEC technical committee 17: Switchgear and controlgear.

This second edition cancels and replaces the first edition which was issued as a technical specification in 2003. It now has the status of an International Standard.

The text of this standard is based on the following documents:

FDIS	Report on voting
17B/XXXX/FDIS	17B/XXXX/RVD

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this publication will remain unchanged until 2008. At this date, the publication will be

- reconfirmed;
- withdrawn;
- replaced by a revised edition, or
- amended.

## INTRODUCTION

IEC 62091 pertains to life-safety equipment and is based in part on NFPA 20 (1996) *Standard for the Installation of Centrifugal Fire Pumps*. When called upon to work by automatic signal, manual-electric signal or manual-emergency actuation, the controller is expected to start the pump driver (motor or diesel engine) because "the building is on fire". Failure to carry out its mission will increase fire damage to the building, its contents and people therein.

These controllers default to a RUN state. They are intended to be located in compliance with local requirements which generally will place them in pump rooms or pump houses that have some specified degree of fire protection. These locations often have sweating overhead pipes, are possibly sprinklered and are in the vicinity of vaults housing other building distribution equipment.

Fire pumps are intended to boost water pressure. Many sprinkler systems are assumed to have small leaks for which "Jockey Pumps" (also known as make-up pumps) are installed to maintain desired pressure in the sprinkler pipes, thus preventing the main fire pump from excessive starts and stops. Experience has shown that leakage water flowing through the fire pump (at rest) over long periods of pump inactivity can carry sand, aggregates, rocks, rust and such which collect in the fire pump. These contaminants may prevent normal starting until the pump impeller accelerates to clear the pump housing. This standard recognizes the condition of under-exercised fire pumps by permitting up to 20 s at locked rotor current whether the starts are "cold starts" (initial starts) or "hot starts" (restarts). Starting a distressed pump may cause temporary or permanent damage to electrical conductors, equipment and the motor because shutdown for equipment protection could possibly permit its destruction by fire along with the building and its contents.

Several examples of the construction and installation applications between a fire pump controller and other controllers include the following:

- 1) **all fire pump controllers**
  - a) The main circuit conductors and components are considered to be sacrificial (i.e. temporary and permanent damage levels are permitted) during any attempt to start a distressed motor/pump and to keep it operating.
  - b) They are expected to provide a high degree of reliability to start the pump driver automatically and suppress a fire upon sensing a pressure drop in the sprinkler pipe or by other automatic fire detection equipment.
  - c) Failures in external control circuits should not prevent operations of pumps from all other internal or other external means.
  - d) External control circuits are expected to be arranged so that failure of any external circuit (open or short-circuit) will not prevent operation of pump(s) from all other internal or external means. Breakage, disconnecting, shorting of the wires or loss of power to these circuits can cause continuous running of the fire pump but should not prevent the controller(s) from starting the fire pump(s) due to causes other than these external circuits.
  - e) External automatic starting means should be accomplished by opening a normally closed contact on the external means to de-energize a normally energized control circuit in the controller.

- f) While external start buttons or other starting means are permitted, the controller should not be equipped with any means to accommodate remote stopping (a remote STOP button should not be used).
- g) Nuisance starts are permitted in the case where a failure of internal control components might cause the motor to start running.

**2) electric motor fire pump controllers**

- a) They are expected to include means for external, manual mechanical operation of the controller in the event of loss of ability to close the contactor electrically/magnetically.
- b) Thermally reactive over-current protective devices should not be permitted. The controller should provide short-circuit and locked rotor protection only.
- c) Releases of the FPC-circuit-breaker (Fire Pump Controller-circuit-breaker) are expected to permit it to carry 300 % of rated operational motor current for an extended period of time.

**3) diesel engine fire pump controllers**

- a) Should provide means to automatically exercise the engine on a weekly basis.
- b) Should not prevent an engine from starting nor shutdown an engine running under demand conditions due to low oil pressure or high engine temperature.

Therefore, the most significant purpose of this standard is to characterize the unique features of fire pump controllers.

## iTeh STANDARD PREVIEW (standards.iteh.ai)

[oSIST prEN 62091:2004](https://standards.iteh.ai/catalog/standards/sist/93d8c248-5783-40d8-b4cd-113bf24fe9d9/osist-pren-62091-2004)

<https://standards.iteh.ai/catalog/standards/sist/93d8c248-5783-40d8-b4cd-113bf24fe9d9/osist-pren-62091-2004>

## LOW-VOLTAGE SWITCHGEAR AND CONTROLGEAR – CONTROLLERS FOR DRIVERS OF STATIONARY FIRE PUMPS

### 1 Scope and object

This standard applies to controllers intended for starting, controlling and stopping stationary fire pumps, including automatic and non-automatic types for alternating current electric motor or diesel engine driven fire pumps. It is anticipated that a controller only controls a single driver.

Controllers for electric motor driven fire pumps always include suitable short-circuit protection as an integral part of the controller. These controllers may include an integral power transfer switch. These controllers are rated 1 000 V a.c. maximum.

Controllers for diesel engine driven fire pumps include electrical circuits that operate various control and supervisory functions such as remote control (starting), alarms, signals, indicators, and the proper operation of battery chargers.

The most significant purpose of this standard is to characterize the unique features of fire pump controllers. A further purpose is to prescribe a procedure for exercising the controllers to verify that the unique features are operative. For the purpose of this standard, this procedure is described as the "fire pump controller test protocol".

The object of this standard is to state the following:

- a) the unique characteristics of fire pump controllers, their associated equipment and their operational functions;
- b) the conditions with which fire pump controllers should comply with reference to:
  - 1) their construction;
  - 2) their critical components including the mounting, arrangement, wiring and connections;
  - 3) the degrees of protection provided by their enclosures;
  - 4) their modes of actuation;
  - 5) their operation and behaviour under normal, overload and short-circuit conditions;
  - 6) their capability to annunciate significant events;
  - 7) their electromagnetic compatibility for the environment into which they are placed;
- c) the tests intended for confirming that these conditions have been met, and the methods to be adopted for these tests;
- d) the information to be given with the equipment, or in the manufacturer's literature.

In this context, this standard gives the requirements for all of the electrical functions associated with both the electric motor driven and the diesel engine driven fire pumps. Special applications such as explosive atmospheres, nuclear installations, ships, aircraft, etc. are not covered by this standard. Referring to electric power sources, the requirements of this standard apply only to the extent that they place limits on the nature, behaviour and characteristics of the electrical energy that is supplied to the service entrance (see IEC 60364-5-55).

The requirements of this standard do not apply to the method or means by which the electrical energy is generated nor to the installation between the origin of the installation and the fire pump controller, which are to be found in the IEC 60364 series. This standard does not apply to diesel engine driven electric generators which may be associated with a stationary fire pump installation.

EMC considerations are correlated with other IEC standards for similar products:

- a) for electric fire pump controllers, EMC considerations are covered by this standard, and
- b) for diesel engine fire pump controllers, d.c. batteries are the intended source of electrical control power.

## 2 Normative references

### 3 Terms and definitions

For the purposes of this standard, the relevant definitions given in IEC 60947-1, together with the following definitions, apply.

#### 3.1 3.1

##### **automatic control**

control of an operation without human intervention

#### 3.2 3.2

##### **automatic transfer switching equipment (automatic power transfer switch)**

self-acting equipment containing the transfer switching device(s) and other necessary devices for monitoring supply circuits and for transferring one or more load circuits from one supply to another (see IEC 60947-6-1)

#### 3.3 3.3

##### **controller**

device or equipment that serves to control, in some predetermined manner, the electric power delivered to the apparatus to which it is connected

<https://standards.iteh.ai/catalog/standards/sist/93d8c248-5783-40d8-b4cd-b14fe9d9/osist-pren-62091-2004>

#### 3.4 3.4

##### **diesel engine fire pump controller**

controller intended to control a diesel engine-driven fire pump

#### 3.5 3.5

##### **diesel engine foam pump controller**

controller intended to control a diesel engine-driven foam concentrate pump

#### 3.6 3.6

##### **driver**

electric motor or diesel engine that drives the fire pump

#### 3.7 3.7

##### **electric fire pump controller**

controller intended to control an electric motor-driven fire pump

#### 3.8 3.8

##### **electric foam pump controller**

controller intended to control an electric motor-driven foam concentrate pump

**3.9 3.9**  
**electromagnetic compatibility**  
**EMC**

ability of an equipment or system to function satisfactorily in its electromagnetic environment without introducing intolerable electromagnetic disturbances to anything in that environment

[IEV 161-01-07]

**3.10 3.10**  
**electromagnetic disturbance**

any electromagnetic phenomenon which may degrade the performance of a device, equipment or system, or adversely affect living or inert matter

NOTE An electromagnetic disturbance may be an *electromagnetic noise*, an *unwanted signal* or a change in the propagation medium itself.

[IEV 161-01-05]

**3.11 3.11**  
**electromagnetic environment**

totality of electromagnetic phenomena existing at a given location

NOTE In general, the electromagnetic environment is time dependent and its description may need a statistical approach.

[IEV 161-01-01]

**3.12 3.12**  
**emission (electromagnetic)**

phenomenon by which electromagnetic energy emanates from a source

[IEV 161-01-08]

**iTeh STANDARD PREVIEW**  
 (standards.iteh.ai)  
 oSIST prEN 62091:2004  
<https://standards.iteh.ai/catalog/standards/sist/93d8c248-5783-40d8-b4cd-113bf24fe9d9/osist-pren-62091-2004>

**3.13 3.13**  
**immunity (to an disturbance)**

ability of a device, equipment or system to perform without degradation in the presence of an electromagnetic disturbance

[IEV 161-01-20]

**3.14 3.14**  
**externally operable**

capable of being operated without the need to remove covers or open an enclosure

**3.15 3.15**  
**fire pump**

pump dedicated to deliver a specified rate of water flow at a specified pressure to the fire extinguishing system of a premises

**3.16 3.16**  
**fire pump controller test protocol**

procedure for exercising fire pump controllers to verify their compliance with the requirements of this standard

**3.17 3.17**  
**foam pump**

pump dedicated to deliver a specified rate of foam concentrate to the system proportioner in the water fire extinguishing system of a premises

**3.18 3.18****foam pump controller**

controller intended to control a foam concentrate pump for use in fire suppression

**3.19 3.19****lockout feature**

externally accessible means to preclude an automatic controller from responding to a start signal

**3.20 3.20****non-automatic control**

control of an operation by human intervention

**3.21 3.21****over-current**

current exceeding the rated current

NOTE For the purpose of this standard, over-current protection includes motor locked-rotor and short-circuit protection only.

**3.22 3.22****pumping unit**

pump, driver and controller

**3.23 3.23****residential fire pump controller**

controller intended to control an electric motor-driven residential fire pump

NOTE Residential fire pumps are fire pumps intended for use primarily in domestic residences. They are typically limited to one- and two-family units, and are generally single-phase devices.

**3.24 3.24****service equipment**

necessary equipment, usually consisting of a circuit-breaker or switch and fuses and their accessories, located near the point of entrance of supply conductors to a building or other structure, or an otherwise defined area, and intended to constitute the main control and means to cut-off the supply

**3.25 3.25****switch-disconnector**

switch which, in the open position, satisfies the isolating requirements specified for a disconnector

[IEV 441-14-12]

**3.26 3.26****system proportioner**

device or coordinated group of devices which introduces foam concentrate in a prescribed proportion into the fire water stream

**3.27 3.27****type-tested device**

device conforming to an established type, comprised of elements (components, devices, equipment) combined and rated as a unit, replicating the constructional and performance features of the typical device which has been verified previously to be in accordance with a designated standard
