

## Standard Terminology of Building Seals and Sealants<sup>1</sup>

This standard is issued under the fixed designation C 717; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reappraisal. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reappraisal.

### 1. Scope

1.1 This standard covers terms, related standard definitions, and descriptions of terms used or likely to be used in standard test methods, specifications, guides, and practices (related to building seals and sealants) consistent with the scope and areas of interest of ASTM Committee C-24.

1.2 Definitions and descriptions of terms are written to ensure that building seals and sealants standards are properly understood and interpreted.

301-72 (1975) Specifications to Structural Concrete for Buildings<sup>8</sup>

### 3. Significance and Use

#### 3.1 Definitions:

3.1.1 Terms and their related standard definitions in Section 4 are intended for use uniformly and consistently in all building seals and sealants test methods, specifications, guides, and practices. The purpose of such use is to promote a clear understanding and interpretation of the standards in which they are used.

3.1.2 Definitions of terms are written in the broadest sense possible, consistent with the intended meaning. Definitions have not been limited to a specific technical field when they can have a multi-field application.

3.1.3 The definition of a term that can have different meanings in different technical fields is preceded by a phrase limiting it to the specific field intended, that is, “in building construction.”

#### 3.2 Description of Terms:

3.2.1 Descriptions of Terms are special purpose definitions intended to provide a precise understanding and interpretation of the seals and sealants standards in which they are used.

3.2.2 A specific description of a term is applicable to the standard or standards in which the term is described and used.

3.2.3 Each standard in which a term is used, in a specially defined manner, should list the term and its description under the subheading, descriptions of terms.

<sup>1</sup> This terminology is under the jurisdiction of ASTM Committee C-24 on Building Seals and Sealants and is the direct responsibility of Subcommittee C24.01 on Terminology of Building Seals and Sealants.

The boldface designations refer to the original source of the definition and the ASTM Technical Committee having jurisdiction.

Current edition approved June 10, 2000. Published June 2000. Originally published as C 717 – 72. Last previous edition C 717 – 99.

4. Terminology

4.1 Terms and Definitions:

**adhesive failure**, *n*—*in building construction*, failure of the bond between the sealant, adhesive, or coating and the substrate surface.

**back bedding**, *n*—See **bedding**.

**back putty**, *n*—See **bedding**.

**back-up material**—See **sealant backing**.

**band aid sealant joint**, *n*—Use **bridge sealant joint** (preferred term).

**bead**, *n*—*in building construction*, in sealants and glazing, a strip of applied sealant, glazing compound, or putty.

**bed**, *v*—*in building construction in glazing*, to apply a bead of sealant between a lite of glass or a panel and the stationary stops or sight bars of the sash or frame.

**bed**, *n*—See **bedding**.

**bedding**, *n*—*in building construction in glazing*, a bead of sealant applied between a lite of glass or a panel and the stationary stop or sight bar of the sash or frame. It is usually the first bead to be applied when setting glass or panels.

**bicellular sealant backing**, *n*—a flexible and very compressible extruded shape (usually cylindrical), with a surface skin, that is composed of both open and closed cell material.

**bite**, *n*—*in building construction in glazing*, the dimensional depth by which the framing system (such as frames, stops, sash, or lock-strip gaskets) overlaps the edge of the glass or panel.

**bloom**, *n*—*in building construction*, a substance formed by blooming.

**blooming**, *v*—*in building construction*, movement or diffusion of a component such as a plasticizer, monomer, unreacted polymer or other formulation ingredient to a sealant, coating, or membrane surface.

**bond breaker**—*in building construction*, a material to prevent adhesion at a designated interface.

**bridge sealant joint**, *n*—*in building construction*, a joint where sealant is applied over the joint to the face of substrates that are in approximately the same plane (see Fig. 1).

DISCUSSION—Not to be confused with joints in bridges.

**building seal**—See **seal**.

**butt glazing**, *n*—*in building construction*, a glazing system wherein butt joints are formed between lites and filled with a glazing sealant.

**butt joint**, *n*—See **butt sealant joint**. (See Fig. 2.)

**butt sealant joint**, *n*—*in building construction*, a joint where sealant is applied within the joint between approximately parallel substrate surfaces that are face-to-edge or edge-to-edge. (See Fig. 2.)

**caulk**, *v*—*in building construction*, to install or apply a sealant across or into a joint, crack, or crevice.

**caulk**, *n*—See **sealant**.

**caulking**, *n*—See **sealant**.

**caulking compound**, *n*—See **sealant**.

**cell**, *n*—a single small cavity surrounded partially or completely by walls. **D 1566; D-11**

**cellular material**, *n*—a generic term for materials containing

FIGURE LEGEND

- B SEALANT BACKING
- C BOND BREAKER
- D JOINT
- E SUBSTRATE FACE
- F SUBSTRATE EDGE

FIG. 1 Bridge Sealant Joint

many cells (either open, closed, or both) dispersed through the mass. **D 1565; D1566; D-11**

**chalk**, *n*—*in building construction*, a powder formed by chalking

DISCUSSION—The powder is not necessarily white.

**chalking**, *v*—*in building construction*, formation of a powder on the surface of a sealant, coating, or membrane that is caused by the disintegration of the polymer or binding medium due to weathering.

DISCUSSION—Chalk on a light color sealant is often white, however a darker color can also exhibit chalking.

**closed cell**, *n*—a cell totally enclosed by its walls and hence not interconnecting with other cells. **D 883; D-20**

**closed cell material**, *n*—a cellular material in which substantially all cells in the mass are closed cells.

**closed cell sealant backing**, *n*—*in building construction*, a flexible and somewhat compressible extruded shape (usually cylindrical), with a surface skin, that is composed of closed cell material.

**cohesive failure**, *n*—*in building construction*, failure characterized by rupture within the sealant, adhesive, or coating.

**cold joint**, *n*—a plane of weakness in concrete caused by an interruption or delay in the placing operation, which permits the first batch to start setting before the next batch is placed, resulting in little or no bond between the two batches.

**compatibility**, *n*—*in building construction*, the capability of two or more materials to be placed in contact or close

FIG. 2 Butt Sealant Joint

proximity with one another and each material maintaining its usual physical or chemical properties, or both.

**compatible materials**, *n*—*in building construction*, compounds or substances that can exist in close proximity to one another without detrimental effects on either.

**compound**, *n*—an intimate mixture of all the ingredients necessary for a finished material or product.

**compression gasket**, *n*—a gasket designed to be used under compression.

**compression glazing**, *n*—see **compression glazing system**.

**compression glazing**, *v*—*in building construction*, the act of installing components into a compression glazing system.

**compression glazing system**, *n*—*in building construction*, gasket(s) or a combination of sealant(s) and gasket(s) used to provide weather-tightness by way of continuous pressure on the components in the joint.

**compression seal**, *n*—a seal which is attained by a compressive force on the sealing material.

**construction joint**, *n*—*in building construction*, a formed or assembled joint at a predetermined location where two

successive placements (“lifts”) of concrete meet.

**DISCUSSION**—Frequently a keyway or reinforcement is placed across the joint. With proper design, this joint may also function as a control or an isolation joint.

**control joint**, *n*—*in building construction*, a formed, sawed, tooled, or assembled joint acting to regulate the location and degree of cracking and separation resulting from the dimensional change of different elements of a structure.

**DISCUSSION**—The joint is usually installed in concrete and concrete masonry construction to induce controlled cracking at preselected locations or where a concentration of stresses is expected.

**creep**, *n*—the time dependent part of a strain resulting from stress.

**D 1079; D-8**

**cure**, *v*—*in building construction*, to attain the intended performance properties of a compound by means of evaporation, chemical reaction, heat, radiation, or combinations thereof.

**cure**, *n*—*in building construction*, the process by which a compound attains its intended performance properties by means of evaporation, chemical reaction, heat, radiation, or combinations thereof.

**cured**, *adj*—*in building construction*, pertaining to the state of a compound that has attained its intended performance properties by means of evaporation, chemical reaction, heat, radiation, or combinations thereof.

**dense rubber**, *n*—*in building construction*, a solid rubber material substantially free of cells or porosity.

**dirt pick-up**, *n*—*in building construction*, soiling caused by a foreign material other than micro-organism growth that is deposited on, adhered to, or embedded into a sealant, coating, or membrane.

**DISCUSSION**—Micro-organism growth can produce a similar appearance.

**dry-film thickness**, *n*—the thickness of a cured film, coating, or membrane.

**edge spacer**, *n*—*in building construction in glazing*, a spacer placed to prevent edge contact and to position laterally a pane of glass or a panel within the supporting frame.

**elastomer**, *n*—a macromolecular material that returns rapidly to approximately its original dimensions and shape after substantial deformation by a weak force and release of the force.

**DISCUSSION**—a) Elastomers are divided into two major polymer systems—thermoset and thermoplastic. b) In standards for rubber, the word elastomer is not to be used interchangeably for the term “rubber”.

**D 1566; D-11**

**elastomeric**, *adj*—having the characteristics of an elastomer.

**elongation**, *n*—extension produced by a tensile stress.

**D 1566; D-11**

**expanded rubber**, *n*—*in building construction*, an elastomeric closed-cell material made by incorporating a gas-producing ingredient into a rubber compound that decomposes during vulcanization, producing gas bubbles that expand the compound; the bubbles are predominately non-interconnecting.

**expansion joint**, *n*—*in building construction*, a formed or assembled joint at a predetermined location, which prevent

the transfer of forces across the joint as a result of movement or dimensional change of different elements of a structure or building.

**expansion joint seal**, *n*—*in building construction*, a seal or sealant system that provides an elastic, compressible, or flexible barrier to the passage of gases, liquids, or solids.

**face glazing**, *n*—the method of glazing in which a rabbeted glazing recess, with no removable stop, is used and a triangular bead of compound is applied to the face of the lite and extended onto the recess.

**fillet bead joint**, *n*—Use **fillet sealant joint** (preferred term). (See Fig. 3.)

**fillet sealant joint**, *n*—*in building construction*, a joint where sealant is applied over the joint to the face of substrates that

are approximately perpendicular to each other (see Fig. 3).  
**flow**, *v*—*in building construction*, the deformation of a tape sealant under stress.

**fluid migration**, *n*—*in building construction*, accumulation of a fluid from a sealant, coating, or membrane on or in an adjacent material.

DISCUSSION—Migration of a non-fluid component can also occur.

**four-side structural sealant glazing**, *n*—*in building construction*, a glazing system wherein all sides of a rectangular-shaped lite or panel are structural sealant glazed.

**gasket**, *n*—any preformed, deformable device designed to be placed between two adjoining parts to provide a seal.

**glazing**, *v*—*in building construction*, the installation of glass or other materials in prepared openings.

**gun-grade**, *n*—*in building construction*, a material of a suitable viscosity to extrude through the nozzle of a hand- or power-operated device.

**hardness**, *n*—the resistance to indentation as measured under specified conditions. **D 1566; D-11**

**hydrostatic pressure**, *n*—a state of stress in which all the principal stresses are equal (and there is no shear stress), as in a liquid at rest; the product of the unit weight of the liquid and the difference in elevation between the given point and the free liquid elevation.

**isolation joint**, *n*—*in building construction*, a formed or assembled joint specifically intended to separate and prevent the bonding of one element of a structure to another and having little or no transference of movement or vibration across the joint.

**joint**, *n*—*in building construction*, the space or opening between two or more adjoining surfaces.

**joint backing**—See **sealant backing**.

**joint filler**, *n*—a compressible material used in a partial or totally filled expansion, control, or isolation joint by its permanent placement in or between building materials such as concrete or masonry during construction; sometimes used as a sealant backing in a partially filled joint.

**knife-grade**, *n*—*in building construction*, a material of a soft, plastic consistency that is applied with a knife or spatula hand tool.

**laitance**, *n*—*in building construction*, a weak layer of cement and aggregate fines on a concrete surface that is usually caused by an overwet mixture, overworking the mixture, improper or excessive finishing, or combinations thereof.

**lap sealant joint**, *n*—*in building construction*, a joint where sealant is applied within the joint between approximately parallel substrates that are face-to-face (see Fig. 4).

**latex foam rubber**, *n*—*in building construction*, an elastomeric open-cell material made by whipping or stirring air or some other gas into rubber latex compound as it is gelled and before it is subsequently cured.

DISCUSSION—The word *latex* must be in front of foam rubber so this material will not be confused with a number of chemically blown, fine cell, elastomeric products, which sometimes are incorrectly called *foam rubber*.

**lift**, *n*—the concrete placed between two consecutive horizontal construction joints.

FIG. 4 Lap Sealant Joints

*light, n*—Use **lite** (preferred term).

**lite, n**—one piece of glazing (also spelled light), synonym: pane. **E 631**

**lock-strip gasket, n**—*in building construction*, a gasket in which sealing pressure is attained by inserting a keyed locking strip into a mating keyed groove in one face of the gasket.

**modulus, n**—as related to sealants used in building construction, the stress (force/unit area) at a corresponding strain (elongation) expressed as a percent of the original dimension.

DISCUSSION—When the stress to strain values are expressed as a ratio, this describes the slope of a line tangent to the given point on the stress-strain curve. This is the tangent modulus.

**modulus, secant**—slope of the line connecting the origin and a given point of the stress-strain curve.

**modulus, tangent, n**—the slope of the line touching (tangent to) the stress-strain curve at a given point on the curve.

**muntin, n**—a secondary intermediate member subdividing a glazed area.

**necking, n**—*in building construction*, the localized reduction in cross section that may occur in a material under stress. **D 883; D-20**

**needle glazing**—*in building construction*, the application of a small bead of a sealant at the sight line adhering to the sash and glass or panel by means of a nozzle with an orifice not exceeding 1/8 in. (3.18 mm) in diameter.

*non-compression glazing, n*—see **non-compression glazing system**.

**non-compression glazing, v**—*in building construction*, the act of installing components into a non-compression glazing system.

**non-compression glazing system, n**—*in building construction*, a sealant or combination of sealant(s) used to provide weather-tightness by way of the adhesive/cohesive characteristics of the components in the joint.

**open cell, n**—a cell not totally enclosed by its walls and hence interconnecting with other cells. **D 1566; D-11**

**open cell material, n**—a cellular material in which substantially all cells in the mass are open cells.

**open cell sealant backing, n**—*in building construction*, a flexible and very compressible fabricated shape (usually

cylindrical), without a surface skin, that is composed of open cell material.

**outgassing, n**—the emission of occluded gasses from a material by vacuum, heat, or pressure.

DISCUSSION—As applied to sealant backing materials contained within a filled joint, outgassing may occur when it is compressed or punctured causing gas bubbles to form in the overlying sealant.

*pane, n*—See **lite**.

**placement, n**—the process of placing and consolidating concrete; a quantity of concrete placed and finished during a continuous operation; also inappropriately called pouring.

*pot life*—See **working life**.

**primer**—*in building construction*, a compatible coating designed to enhance adhesion.

**putty, n**—a knife-grade sealant.

**rabbet, n**—a two-sided, L-shaped, recess in a sash or frame designed to receive glazing.

DISCUSSION—Provides a fixed stop in the sash or frame.

**reglet, n**—a continuous groove, slot or recess within a building component surface which receives other components such as flashing, gaskets or anchors; a continuous prefabricated metal or plastic device containing a groove, slot or recess which can be cast into (as a form) or mounted onto a building component surface.

**reinforced joint, n**—a concrete joint bridged by reinforcing steel embedded in both joining parts.

**reversion, n**—*in building construction in joint sealing*, a loss of elastomeric properties and a decrease in durometer hardness of a seal or cured sealant following environmental exposure.

DISCUSSION—Softening and the ability to permanently reshape a seal or sealant usually characterizes reversion. Depending on a specific seal or sealant formulation, high heat, ultraviolet radiation, or moisture (as a liquid or vapor) may cause reversion acting either alone or in combination. The seal and sealant industry is not in agreement on reversion causes.

**rundown, n**—*in building construction*, bloom or fluid migration from a sealant, coating, or membrane that due to natural forces is carried down and accumulates on vertical and sloping surfaces.

DISCUSSION—Similar patterns of discoloration can be caused by other than blooming and fluid migration.

**seal, n**—*in building construction*, a barrier against the passage of liquids, solids, or gases.

**sealant**—*in building construction*, a material that has the adhesive and cohesive properties to form a seal.

**sealant, chemically curing, n**—*in building construction*, a compound that cures primarily through chemical reaction.

*sealant, emulsion* —See **sealant, latex**.

**sealant, hot-applied, n**—*in building construction*, a compound that is applied in a molten state and cures primarily by cooling to ambient temperatures.

DISCUSSION—A hot-applied sealant is sometimes called a hot-melt sealant.

**sealant, latex, n**—*in building construction*, a compound that cures primarily through water evaporation.

DISCUSSION—The terms latex sealant and emulsion sealant are sometimes used interchangeably.

**sealant, non-sag**, *n*—*in building construction*, a compound that exhibits little or no flow when applied in vertical or inverted joints.

**sealant, preshimmied**, *n*—*in building construction*, a sealant having encapsulated therein solids or discrete particles that limit its deformation within a joint under compression.

DISCUSSION—The sealant may be in tape or bulk form. Encapsulated solids or particles may include such materials as continuous rods of resilient plastic or rubber, glass beads, or string, which act as shims or space fillers.

**sealant, preshimmied tape**, *n*—*in building construction*, a preshimmied sealant in tape sealant form.

DISCUSSION—The shim is usually a continuous plastic or rubber rod or discrete particles placed within the body of the tape sealant to regulate the compressibility of the tape sealant. See also **sealant, tape** and **sealant, preshimmied**.

**sealant, self-leveling**, *n*—*in building construction*, a compound that exhibits flow sufficient to seek gravitational leveling.

**sealant, silicone**, *n*—*in building construction*, a liquid-applied curing compound based on polymer(s) of polysiloxane structures.

**sealant, structural**, *n*—*in building construction*, a sealant capable of transferring dynamic or static (“live” or “dead,” or both) loads, or both, across joint members exposed to service environments typical for the structure involved.

**sealant, tape**, *n*—*in building construction*, a sealant having a preformed shape, and intended to be used in a joint initially under compression.

**sealant backing**—*in building construction*, a compressible material placed in a joint before applying a sealant.

DISCUSSION—The purpose of the sealant backing is to assist in providing the proper sealant configuration, to limit the depth of the sealant, and in some cases, to act as a bond breaker.

**sealing material**, *n*—See **seal**.

**sealing tape**—See **sealant, tape**.

**secant modulus**—See **modulus, secant**.

**setting block**, *n*—*in building construction in glazing*, a piece of resilient material placed to support, to distribute the load, to prevent edge contact, and to align a pane of glass or a panel within its supporting frame.

**shelf-life**—*in building construction*, the maximum time packaged materials can be stored under specified conditions and still meet the performance requirements specified.

**shim**—See **shim spacer**; **spacer**.

**shim spacer**, *n*—*in building construction in glazing*, a spacer designed and placed to position the face surfaces of a pane of glass or a panel between the stops and to prevent glass or panel contact with the stops.

**shrinkage**—a decrease in length, area, or volume. **D 2102; D-13**

**sight line**—*in building construction in glazing*, the line of intersection of an opaque material with a transparent material.

**skin**, *n*—*in building construction*, a thin layer at the surface of

a sealant, cellular rubber gasket, sealant backing, or joint filler that differs in physical properties from the material beneath it.

DISCUSSION—The skin generally decreases the degree of permeability to water or air, or both, through or into a cellular rubber gasket, sealant backing, or joint filler. On sealants, the skin generally offers reduced surface tack, resistance to dirt accumulation, a degree of resistance to mechanical surface deformation damage, and typically indicates the end of tooling time.

**solvent-release sealant**, *n*—*in building construction*, a compound that cures primarily through solvent evaporation.

**spacer**, *n*—*in building construction in glazing*, a piece of resilient material placed to maintain space between a pane of glass or a panel and its supporting frame.

**spall**, *n*—a fragment or chip as from concrete, brick, stone or other similar materials.

**spall**, *v*—to break off fragments or chips, as from concrete, brick, stone or other similar materials, by water freezing within the material, corrosion expansion of embedded metal, movement pressures, or other physical or chemical processes.

**spalling**, *adj*—the development of spalls.

**sponge rubber**, *n*—*in building construction*, an elastomeric open-cell material made by incorporating a gas-producing ingredient into a rubber compound, which expands the rubber compound during vulcanization into a material containing cells that are predominately interconnecting.

**stop**, *n*—*in building construction*, in sealants and glazing, a strip of metal, plastic, or wood used around the periphery of a lite of glass or a panel to secure it in place (also referred to improperly as a bead).

**stopless glazing**—See **structural sealant glazing**, the preferred term.

DISCUSSION—Inappropriately used to describe structural sealant glazing.

**structural sealant glazing**, *n*—*in building construction*, a glazing system wherein a structural sealant is used to transfer loads between a lite or panel and a supporting framework, without mechanical fasteners or other methods of attachment.

**substrate**, *n*—*in building construction*, (1) a material upon which films, treatments, adhesives, sealants, membranes, and coatings are applied; (2) materials that are bonded or sealed together by adhesives or sealants.

**tangent modulus**—See **modulus, tangent**.

**thermoplastic elastomer**, *n*—a material having the general properties of an elastomer and capable of being repeatedly softened by heat and hardened to shape by cooling without significant degradation of the polymer system.

DISCUSSION—Thermoplastic elastomers have some of the properties of thermoset elastomers, but are typically more thermally and pressure sensitive and more sensitive to solvents.

**thermoset elastomer**, *n*—an elastomeric material that attains its intended properties by an irreversible cross-linking reaction caused by heat alone, heat with a cross-linking agent,
