About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

IEC Catalogue - webstore.iec.ch/catalogue

The stand-alone application for consulting the entire bibliographical information on IEC International Standards, Technical Specifications, Technical Reports and other documents. Available for PC, Mac OS, Android Tablets and iPad.

IEC publications search - www.iec.ch/searchpub

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and also once a month by email.

Electropedia - www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing more than 30 000 terms and definitions in English and French, with equivalent terms in 14 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

More than 55 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: csc@iec.ch.

A propos de l'IEC

La Commission Electrotechnique Internationale (IEC) est la première organisation mondiale qui élabore et publie des Normes internationales pour tout ce qui a trait à l'électricité, à l'électronique et aux technologies apparentées.

A propos des publications IEC

Le contenu technique des publications IEC est constamment revu. Veuillez vous assurer que vous possédez l'édition la plus récente, un corrigendum ou amendement peut avoir été publié.

Catalogue IEC - webstore.iec.ch/catalogue

Application autonome pour consulter tous les renseignements bibliographiques sur les Normes internationales, Spécifications techniques, Rapports techniques et autres documents de l'IEC. Disponible pour PC, Mac OS, tablettes Android et iPad.

Recherche de publications IEC - www.iec.ch/searchpub

La recherche avancée permet de trouver des publications IEC en utilisant différents critères (numéro de référence, texte, comité d'études,...). Elle donne aussi des informations sur les projets et les publications remplacées ou retirées.

IEC Just Published - webstore.iec.ch/justpublished

Restez informé sur les nouvelles publications IEC. Just Published détaille les nouvelles publications parues. Disponible en ligne et aussi une fois par mois par email.

Electropedia - www.electropedia.org

Le premier dictionnaire en ligne de termes électroniques et électriques. Il contient plus de 30 000 termes et définitions en anglais et en français, ainsi que les termes équivalents dans 14 langues additionnelles. Egalement appelé Vocabulaire Electrotechnique International (IEV) en ligne.

Glossaire IEC - std.iec.ch/glossary

Plus de 55 000 entrées terminologiques électrotechniques, en anglais et en français, extraites des articles Termes et Définitions des publications IEC parues depuis 2002. Plus certaines entrées antérieures extraites des publications des CE 37, 77, 86 et CISPR de l'IEC.

iTeh STANDARD PREVIEW (standards.iteh.ai)

IEC 60904-8:2014

<https://standards.iteh.ai/catalog/standards/sist/2bda31f6-21bf-4493-a950-d1f3ea994c06/iec-60904-8-2014>

INTERNATIONAL ELECTROTECHNICAL COMMISSION

PHOTOVOLTAIC DEVICES –

**Part 8: Measurement of spectral responsivity
of a photovoltaic (PV) device**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 60904-8 has been prepared by IEC technical committee 82: Solar photovoltaic energy systems.

This third edition cancels and replaces the second edition published in 1998 and constitutes a technical revision.

The main technical changes with respect to the previous edition are listed below:

- Re-writing of the clause on testing
- Addition of a new clause for the measurement of series-connected modules
- Addition of the requirements of ISO/IEC 17025
- Additional figures

The text of this standard is based on the following documents:

FDIS	Report on voting
82/822/FDIS	82/843/RVD

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

A list of all parts in the IEC 60904 series, published under the general title *Photovoltaic devices*, can be found on the IEC website.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC web site under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

PHOTOVOLTAIC DEVICES –

Part 8: Measurement of spectral responsivity of a photovoltaic (PV) device

1 Scope

This International Standard specifies the requirements for the measurement of the spectral responsivity of both linear and non-linear photovoltaic devices. It is only applicable to single-junction devices. The spectral responsivity of a photovoltaic device is used in cell development and cell analysis, as it provides a measure of recombination and other processes occurring inside the semiconductor or cell material system.

The spectral responsivity of a photovoltaic device is used for the correction of the spectral mismatch if a PV device is calibrated in a setup where the measurement spectrum is different from the reference spectral irradiance data given in IEC 60904-3 and a reference device with a different spectral responsivity to the device under test is used. This procedure is given in IEC 60904-7.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 60904-3, *Photovoltaic devices – Part 3: Measurement principles for terrestrial photovoltaic (PV) solar devices with reference spectral irradiance data*

IEC 60904-7, *Photovoltaic devices – Part 7: Computation of the spectral mismatch correction for measurements of photovoltaic devices*

IEC 60904-9, *Photovoltaic devices – Part 9: Solar simulator performance requirements*

IEC 61215, *Crystalline silicon terrestrial photovoltaic (PV) modules – Design qualification and type approval*

IEC 61646, *Thin-film terrestrial photovoltaic (PV) modules – Design qualification and type approval*

IEC/TS 61836, *Solar photovoltaic energy systems – Terms, definitions and symbols*

ISO/IEC 17025, *General requirements for the competence of testing and calibration laboratories*

3 Marking

Each photovoltaic device should carry a clear and indelible marking. This marking should be cross-referenced against:

- name, monogram or symbol of the manufacturer;
- base material and type of photovoltaic device;

- type number or identification, if available;
- serial number, if applicable.

When the photovoltaic devices to be tested are prototypes of a new design and not from production, this fact shall be noted in the test report (see Clause 10).

4 Testing

4.1 General

The photovoltaic device shall be subjected to one of the procedures for spectral responsivity measurements defined in Clauses 7 to 9.

4.2 Special considerations

Preconditioning – Before beginning the measurements, the device under test shall be stabilized (if necessary) by an appropriate light soaking test procedure, as specified in IEC 61215 or IEC 61646. Different photovoltaic technologies may require different preconditioning procedures.

4.3 Measurement under white bias light

The procedures in Clause 7 and 9 require a white bias light being applied to the device under test during the determination of spectral responsivity. Under bias light conditions, not the spectral responsivity but rather the differential spectral responsivity is measured. The spectral responsivity can be determined from the differential spectral responsivity by taking the non-linearity into account based on a series of differential spectral responsivity measurements at bias light levels generating short-circuit currents in the device ranging from 5 % to 110 % of that at standard test conditions (see Clause 5). Most crystalline silicon solar cells have a differential spectral responsivity at a bias light generating 30 % to 40 % of their short-circuit current at standard test conditions that is identical to the spectral responsivity at standard test conditions. Therefore, the measurement should be performed with such bias light levels if the non-linearity of a crystalline silicon PV device is not determined. If the non-linearity is confirmed to be negligible, i.e. the differential spectral responsivity is constant within the irradiance range of interest, the differential spectral responsivity at a specific bias light level may be used. For details see Clause 5.

4.4 Applying a bias voltage to the device under test

Generally, the spectral responsivity of a photovoltaic device is measured at short-circuit conditions (zero bias voltage) of the photovoltaic device and used for the purposes of cell analysis and calculating the spectral mismatch.

In order to measure the spectral responsivity of the specimen under a specific voltage, a bias voltage may need to be applied. The bias voltage of the device shall be controlled by an external voltage source. If a bias voltage is applied it shall be specified in the report.

5 General description of spectral responsivity measurement

The spectral responsivity of a photovoltaic (PV) device is measured by irradiating it by means of a narrow-bandwidth light source at a series of different wavelengths covering its responsivity range, and measuring the short-circuit current and monochromatic irradiance at each of these wavelengths (formula 1), or short-circuit current and monochromatic light beam power (formula 2). The first type of measurement results in the spectral irradiance responsivity with the unit $A/W \cdot m^{-2}$. In order to determine the spectral responsivity as defined in IEC/TS 61836 this needs to be divided by the area of the device under test whereas the second type results directly in the spectral responsivity in the unit A/W.

In order to determine the output current of the device, the bias light as well as the monochromatic light should irradiate the entire area of the device uniformly. It is important to illuminate effectively the entire area of the device, as light not directly falling onto the active area may also contribute to the measured signal. If the spectral responsivity is used for the calculation of the spectral mismatch correction according to IEC 60904-7 the illuminated area during the measurement of the spectral responsivity should be identical to that during the measurement of the current-voltage characteristics. This is normally the entire device area. If not it should be suitably delimited by an aperture.

In case the area of the device is larger than the respective beam sizes the latter should be scanned appropriately across the entire device area to provide a uniform illumination. If both beams are scanned, the scanning should be synchronous with the bias light always illuminating a spot larger than the monochromatic light.

The temperature of the device should be controlled.

The current density of the device under test at each wavelength is divided by the respective irradiances to give spectral responsivity.

$$s(\lambda) = I_{sc}(\lambda)/E(\lambda)/A \quad (1)$$

where:

$s(\lambda)$ is the spectral responsivity of the device under test at the wavelength λ ;

$I_{sc}(\lambda)$ is the short-circuit current of the device under test at the wavelength λ ;

$E(\lambda)$ is the irradiance of the light source at the wavelength λ ;

A is the area of the device under test.

The area of the device under test shall be noted in the test report.

Alternatively, the short-circuit current $I_{sc}(\lambda)$ and the radiant power incident on the device $P(\lambda)$ may be measured. The spectral responsivity is then determined as:

$$s(\lambda) = I_{sc}(\lambda)/P(\lambda) \quad (2)$$

where:

$I_{sc}(\lambda)$ is the short-circuit current of the device under test at the wavelength λ ;

$P(\lambda)$ is the radiant power incident on the device at the wavelength λ .

The determination of $P(\lambda)$ requires the measurement of the area of the device under test. This area shall be noted in the test report.

In practice (see Clauses 7 and 9) a small modulated signal originating from the monochromatic light is superimposed on a large bias signal originating from the white bias light. In such cases the evaluated quantities need to be treated as differential and a wavelength dependent differential spectral responsivity (DSR) $\tilde{s}(\lambda, E)$ is determined for a specific bias light irradiance E . The spectral responsivity at standard test conditions $s(\lambda)|_{STC}$ will equal the differential spectral responsivity only if the device is strictly linear. If the non-linearity is confirmed to be negligible, the differential spectral response at a specific bias light level may be used. For example, if the differential spectral response or the resultant spectral mismatch factor is constant within the bias light levels to generate the I_{sc} between 5 % and 110 % of standard test conditions, the differential spectral response at a bias level of 100 % of standard test conditions may be used. In all other cases the DSR shall be measured at a sufficient number of bias irradiances and the resultant spectral responsivity can be calculated or a specific bias light irradiance E_0 shall be found with $\tilde{s}(\lambda, E_0) \approx s(\lambda)|_{STC}$.

6 Apparatus

6.1 General

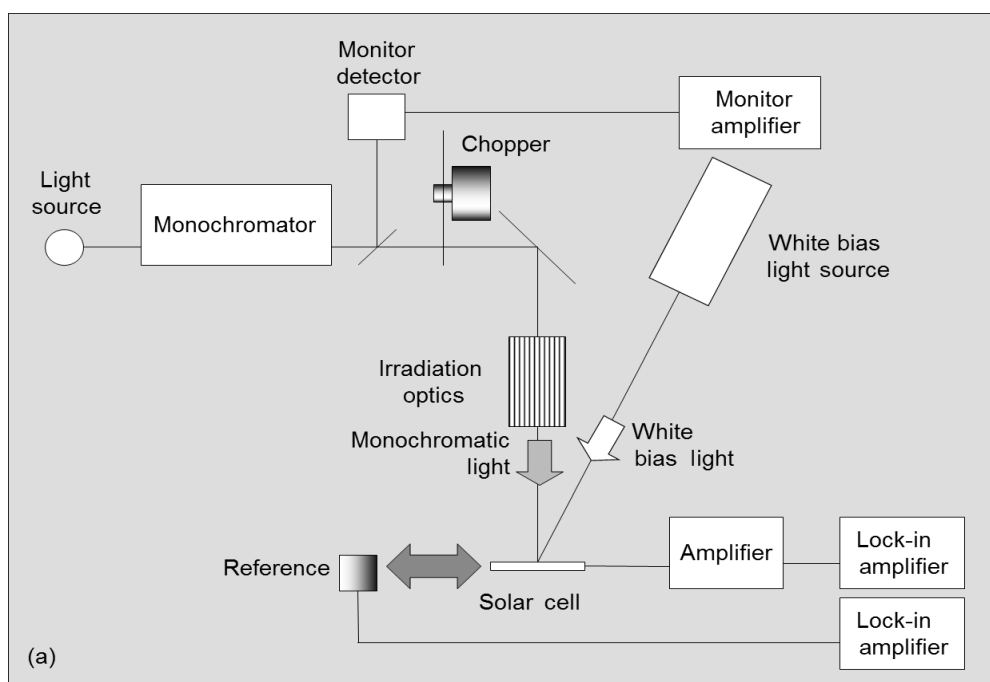

A spectral responsivity measurement system consists of a continuous (chopped or unchopped) or pulsed monochromatic light source, an optional beam splitting assembly with a monitor detector, a device stage able to hold the device under test, a reference device, an optional bias light assembly and electrical instrumentation. Figures 1(a, b) and 2(a, b) show examples of test arrangements for the measurement of the DSR of a solar cell.

If an optical chopper is used (Figures 1 and 2) care needs to be taken that no bias light reflected of the optical chopper reaches the test plane.

(standards.iteh.ai)

IEC 1172/14

Figure 1b) – Chopper ahead of monochromator

Figure 1 – Example block diagram of a differential spectral responsivity measuring instrument using a continuous light source and a grating monochromator

Figure 2a) – Filter ahead of chopper

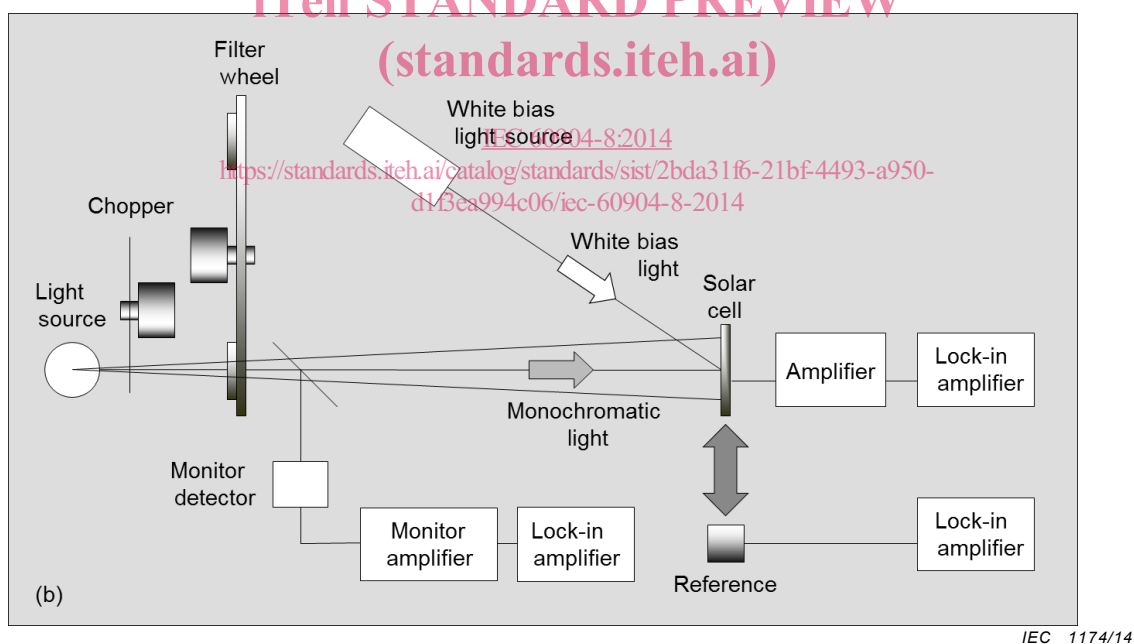

Figure 2b) – Chopper ahead of filter

Figure 2 – Example block diagram of a differential spectral responsivity measuring instrument using a continuous light source and bandpass filters

6.2 Monochromatic light source

The monochromatic light is usually generated by a light source and monochromator (for example a grating) or filter wheel with bandpass filters. The bandwidth (Full Width at Half Maximum, FWHM) of the monochromatic light should not exceed 20 nm for spectral responsivity measurements in the range between 300 nm and 1200 nm. In the range up to 3000 nm, the bandwidth should not exceed 50 nm.
