## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

All published ETSI deliverables shall include information which directs the reader to the above source of information.

---

## Foreword

This Candidate Harmonized European Standard (Telecommunications series) has been produced by ETSI Technical Committee Electromagnetic compatibility and Radio spectrum Matters (ERM).

The present document has been produced by ETSI in response to a mandate from the European Commission issued under Council Directive 98/34/EC [43] (as amended) laying down a procedure for the provision of information in the field of technical standards and regulations.

The present document is intended to become a Harmonized Standard, the reference of which will be published in the Official Journal of the European Communities referencing the Council Directive on the approximation of the laws of the Member States relating to electromagnetic compatibility ("the EMC Directive") (89/336/EEC [41] as amended).

### iTeh STANDARD PREVIEW National transposition dates (standards.iteh.ai)

Date of adoption of this EN:	25 April 2003
Date of latest announcement of this EN (doa):	31 July 2003
Date of latest publication of new National Standard or endorsement of this EN (dop/e):	31 January 2004
Date of withdrawal of any conflicting National Standard (dow):	31 July 2006

---

# 1 Scope

The present document covers the EMC requirements for equipment intended to be used within a telecommunications network (as defined in clause 3). Examples of such equipment are:

- **Switching equipment.** Such equipment includes:
    - local telephone exchanges;
    - remote switching concentrators;
    - international switches;
    - telex switches;
    - network packet switches.
  - General purpose equipment, which is used as a part of a switching system, may be covered by the scope of other standards. For such equipment, if those other standards fully cover all the requirements of the present document, no further requirements are necessary. Switching equipment can also contain transmission functions, and this has to be recognized during testing.
  - Non-radio transmission equipment and ancillary equipment. Such equipment includes:
    - multiplexers;
    - line equipment and repeaters, e.g. equipment for:
      - Synchronous Digital Hierarchy (SDH);
      - Plesiochronous Digital Hierarchy (PDH);
      - Asynchronous Transfer Mode (ATM);
- such as:
- Digital Cross Connect systems;
  - network terminations;
  - transmission equipment used in the access network like XDSL.
- **Power supply equipment.** Such equipment includes:
    - central power plant;
    - end of suite power supplies;
    - uninterruptible power supplies;
    - stabilized AC power supplies;
    - and other dedicated telecommunication network power supplies;

but excludes equipment which is uniquely associated with or integrated in other equipment.

- **Supervisory equipment.** Such equipment includes:
  - network management equipment;
  - operator access maintenance equipment;
  - traffic measurement systems;
  - line test units;
  - functional test units.

The function of *supervision* may either be performed by independent equipment or form part of other telecommunication equipment. If the function of supervision forms part of a telecommunication equipment, the performance may be evaluated simultaneously with other functions (such as switching and transmission) during EMC testing.

The environmental classification used in the present document refers to TR 101 651 [42].

The requirements of the present document have been selected to ensure an adequate level of immunity for the apparatus covered by the scope of the present document. The levels do not, however, cover extreme cases which may occur at any location but with a low probability of occurrence. In special cases, situations may arise where the levels of disturbance may exceed the immunity test levels specified in the present document. In these instances, special mitigation measures may have to be employed.

Equipment for cabled distribution systems intended only for television and sound signals as defined in EN 50083-2 [3] and optical amplifiers as defined in ITU-T Recommendations G.661 [23] and G.662 [24] are outside the scope of the present document.

## 3 Definitions and abbreviations

### 3.1 Definitions

For the purposes of the present document, the following terms and definitions apply. The definitions taken from the IEC 60050-161 [20] have reference in parentheses.

**AC secondary interface:** output port of an AC power supply

**AC secondary voltage:** output of the AC power supply at the AC secondary interface

NOTE: The AC secondary voltage may be either:

- a stabilized AC supply derived from a DC primary supply (e.g. where the power supply is an inverter); or
- derived from the AC primary supply (e.g. a stabilized power supply used where the quality of the primary supply is not sufficient to feed telecommunication equipment).

**burst (161-02-07):** sequence of a limited number of distinct pulses or an oscillation of limited duration

**connection:** temporary association of transmission channels or telecommunication circuits, switching or other functional units set up to provide for the transfer of information between two or more points in a telecommunication network (IEC 60050-714)

**continuous disturbance (161-02-11):** electromagnetic disturbance the effects of which on a particular device or equipment cannot be resolved into a succession of distinct effects

**DC secondary interface:** output port of a DC power supply

**DC secondary voltage:** output of the DC power supply at the DC secondary interface

The DC secondary voltage may be derived from the AC primary supply with or without a buffer battery.

**duration (of a voltage change) (161-08-03):** interval of time for the voltage to increase or decrease from the initial value to the final value

**duration (of a pulse):** interval of time between the instants at which the instantaneous value of a pulse reaches 50 % of the pulse magnitude for the first and last time

**enclosure port:** physical boundary of the Equipment Under Test (EUT) through which electromagnetic fields may emanate or on which they may impinge

**environment, environmental conditions:** electromagnetic conditions external to the equipment, to which it is subjected at a certain time

The environmental conditions comprise a combination of single environmental parameters and their severity.

**environmental parameters:** present one or more properties of the electromagnetic environment

**immunity (to a disturbance) (161-01-20):** ability of a device, equipment or system to perform without degradation in the presence of an electromagnetic disturbance

**impulsive disturbance (161-02-09):** electromagnetic disturbance which, when incident on a particular device or equipment, manifests itself as a succession of distinct pulses or transients

**interface "A":** terminals at which a power supply is connected to the telecommunications equipment

**multimedia network equipment:** multimedia network equipment containing broadcast and telecommunication functions
