This European Standard was approved by CEN on 1993-05-25. CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CEN member.

The European Standards exist in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Central Secretariat has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

### Foreword

On the proposal of the CEN Central Secretariat, the Technical Board has decided to submit the international Standard:

"Information technology - Computer graphics - Graphical Kernel System for Three Dimensions (GKS-3D) language bindings - Part 4: C (ISO/IEC 8806-4:1991)"

to the formal vote.

The result of the formal vote was positive.

For the time being, this document exists only in English and in French.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by November 1993, and conflicting national standards shall be withdrawn at the latest by November 1993.

In accordance with the CEN/CENELEC Internal Regulations, the following countries are bound to implement this European Standard:

Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

**ISO/IEC 8806-4 : 1991(E)****Foreword**

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) together form a system for worldwide standardization as a whole. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with the fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

International Standard ISO/IEC 8806-4 was prepared by Joint Technical Committee ISO/IEC JTC1, *Information technology*.

ISO/IEC 8806 consists of the following parts, under the general title

*Information technology - Computer graphics - Graphical Kernel System for Three Dimensions (GKS-3D) language bindings -*

- *Part 1: FORTRAN*
- *Part 2: PASCAL*
- *Part 3: ADA*
- *Part 4: C*

Annexes A to F of this part of ISO/IEC 8806 are for information only.

## Introduction

The Graphical Kernel System for Three Dimensions (GKS-3D) functional description is registered as ISO 8805 : 1988. As explained in the Scope and Field of Application of ISO 8805, that International Standard is specified in a language independent manner and needs to be embedded in language dependent layers (language bindings) for use with particular programming languages.

The purpose of this part of ISO/IEC 8806 is to define a standard binding for the C computer programming language.

Some functions in ISO 8805 also appear in the Graphical Kernel System (GKS) functional description (ISO 7942). The binding of those functions in this part of ISO/IEC 8806 is the same as in ISO/IEC 8651-4, the C language binding of GKS.

# Information technology – Computer graphics – Graphical Kernel System for Three Dimensions (GKS-3D) language bindings -

## Part 4:

### C

#### 1 Scope

The Graphical Kernel System for Three Dimensions (GKS-3D), ISO 8805 : 1988 , specifies a language independent nucleus of a graphics system. For integration into a programming language, GKS-3D is embedded in a language dependent layer obeying the particular conventions of that language. This part of ISO/IEC 8806 specifies such a language dependent layer for the C language.

<https://standards.iteh.ai/catalog/standards/sist/8386b90b-e951-445b-8399-ee8f28991c18/sist-en-28806-4-1997>

### 3 The C Language Binding of GKS-3D

The C language binding of GKS-3D shall be as described in clauses 3, 4, 5 and 6.

#### 3.1 Conformance

This part of ISO/IEC 8806 incorporates the rules of conformance defined in the GKS-3D Standard (ISO 8805) for GKS-3D implementations, with those additional requirements specifically defined for C bindings in GKS-3D.

The following criteria shall determine conformance of an implementation to this part of ISO/IEC 8806:

In order to conform, an implementation of the C binding of GKS-3D shall implement a specific level of GKS-3D as specified in ISO 8805. It shall make visible all of the declarations in the C binding specified in this part of ISO/IEC 8806 for that same level of GKS-3D and all lower levels and for a specific level of C.

Thus, for example, the syntax of the function names shall be precisely as specified in the binding and parameters shall be of the data types stated in the binding.

#### 3.2 Functions versus Macros

An implementation may substitute macros for functions. However, the macros shall be designed so that side-effects work properly. In general, a macro cannot be used to replace the error handling function `gerr_hand`. See also 3.10.

#### 3.3 Character Strings

The C language represents character strings as an array of characters terminated by the null character (i.e. `'\0'`). This means that the null character is not usable as a printable character.

#### 3.4 Function Identifiers

The function names of GKS-3D are all mapped to C functions which begin with the letter `g`. Words and phrases used in the GKS-3D function names are often abbreviated in the representation and are always separated with the underscore character `"_"`. The set of such abbreviations is given in 4.2, and the resulting C function names are listed in 4.3. For example, the abbreviation for the GKS-3D function DELETE SEGMENT FROM WORKSTATION is `gdel_seg_ws`. `del`, `seg`, and `ws` are abbreviations for DELETE, SEGMENT, and WORKSTATION. The conjunctive FROM is mapped to the null string.

The C standard (ISO/IEC 9899) requires that compilers recognize internal identifiers which are distinct in at least 31 characters. That standard also requires that external identifiers (i.e. those seen by the linker) be recognized to a minimum of six characters, independent of case.

Implementations which run in environments where two distinct C internal identifiers would be equivalent, if they were both external identifiers, shall include a set of `#defines` in the header file which equate the long names to a set of short names. A possible set of short names for a compiler that accepts only eight characters for external definitions may be found in annex D.

#### 3.5 Registration

ISO 8805 reserves certain value ranges for registration<sup>1</sup> as graphical items. The registered graphical items will be bound to the C programming language (and other programming languages). The registered item

<sup>1</sup>) For the purpose of this part of ISO/IEC 8806 and according to the rules for the designation and operation of registration authorities in the ISO/IEC Directives, the ISO and IEC councils have designated the National Institute of Standards and Technology (Institute of Computer Sciences and Technology), A-266 Technology Building, Gaithersburg, MD 20899, USA to act as registration authority.

**Registration****The C Language Binding of GKS-3D**

binding will be consistent with the binding presented in this part of ISO/IEC 8806.

**3.6 Identifiers for Graphical Items**

Generalized Drawing Primitives and Escape functions are referenced via identifiers. This part of ISO/IEC 8806 specifies the format of the identifiers but it does not specify the registration of the identifiers. The identifiers are used as arguments to the functions `ggdp`, `ggdp3`, and `gescape`.

An implementation may also represent GDPs and Escapes as separate functions, but this is not required.

There are two formats for these identifiers. One format is for registered GDPs and Escapes and the other format is for unregistered GDPs and Escapes.

The format for registered GDP identifiers is:

```
#define    GGDP_Rn      (n) /* 'n' is the registered GDP id. */
#define    GGDP3_Rn    (n) /* 'n' is the registered GDP3 id. */
```

The format for unregistered GDP identifiers is:

```
#define    GGDP_Un     (-n) /* 'n' is implementation dependent */
#define    GGDP3_Un    (-n) /* 'n' is the registered GDP3 id. */
```

The format for registered Escape function identifiers is:

```
#define    GESCAPE_Rn  (n) /* 'n' is the registered Escape id. */
```

The format for unregistered Escape function identifiers is:

```
#define    GESCAPE_Un  (-n) /* 'n' is implementation dependent */
```

**3.7 Return Values**

All GKS-3D/C functions return `void`.

**3.8 Header Files**

C provides a mechanism to allow external files to be included in a compilation. Clause 5 of this part of ISO/IEC 8806 describes the data types that shall be defined in the file `gks.h` which should be included in any application program that intends to use GKS-3D via the C binding.

This part of ISO/IEC 8806 uses the data type `size_t` (as a field in the data type `Gdata`). The type `size_t` is environment-dependent (e.g. `int`, `long int`, `unsigned int`) and is defined in the file `<stddef.h>`. Therefore the file `gks.h` shall also include the file `<stddef.h>`.

Additional implementation-dependent items may be placed in this file if needed. These items should start with the sentinel "G" or "g", as far as applicable.

The file `gks.h` shall also contain external declarations for all GKS-3D/C functions because they return `void`. For example, the declaration for the function `gopen_gks` would look like this:

```
extern void gopen_gks(char *err_file, size_t mem_units);
```

**3.9 Memory Management**

The application shall allocate the memory needed for the data returned by the implementation. In general, the application will allocate a C structure and pass a pointer to that structure to an inquiry routine, which will then place information into the structure. However, a number of inquiry functions return variable length data, the length of which is not known *a priori* by the application.

These functions fall into two classes. One class of functions returns a simple, homogeneous, list of items. For example, the function INQUIRE SET OF SEGMENT NAMES returns a list of the segment names in use. The other class returns complex, heterogeneous data structures. For example, the function INQUIRE LOCATOR DEVICE STATE returns the device state which includes a locator data record; the data record can contain arbitrarily complex implementation-defined data structures. The binding of these two classes of functions is described in detail below. Subclause 3.10 describes the errors that can be invoked during execution of functions which use the memory management policy.

### 3.9.1 Functions which Return Simple Lists

Inquiry functions which return a list of items are bound such that the application can inquire about a portion of the list. This list is a subset of the implementation's internal list and is called the application's list. This allows the application to process the implementation's list in a piecewise manner rather than all at once.

The application allocates the memory for a list and passes that list to the implementation. The implementation places the results of the inquiry into the list. In order to support this policy of memory management, three additional parameters have been added to functions which return lists:

- a) `num_elems_appl_list`: An integer input parameter which is the length of the application's list. The value of `num_elems_appl_list` indicates the number of items (i.e. list elements) which will fit into the application list. A value of 0 is valid and allows the application to determine the size of the implementation's list (which is returned via `num_elems_impl_list`) without having the implementation return any of the elements of its list. If `num_elems_appl_list` is negative, `GE_APPL_LIST_LENGTH_LT_ZERO` is returned as the value of the error indicator parameter.
- b) `start_ind`: An integer input parameter which is an index into the implementation's list. (Index 0 is the first element of both the implementation's and application's list.) `start_ind` indicates the first item in the implementation's list that is copied into index 0 of the application's list. Items are copied sequentially from the implementation's list into the application's list until the application's list is full or there are no more items in the implementation's list. If `start_ind` is out of range, error `GE_START_IND_INVALID` is returned as the value of the error indicator parameter.
- c) `num_elems_impl_list`: An output parameter which is a pointer to an integer. The implementation stores into this parameter the number of items that are in the implementation's list.

In annex E, a possible underlying mechanism is described.

[SIST EN 28806-4:1997](https://standards.iteh.ai/catalog/standards/sist/28806-4:1997)

### 3.9.2 Functions which Return Complex Data Structures

The data returned by the ESCAPE function and the functions which return input device data records or pattern tables can be complex in structure. They cannot be represented by a simple list of items. It would be an onerous task for the application to have to allocate and prepare data structures for these routines. In order to facilitate this task of using these inquiry functions, the binding defines a new resource, called a *Store*, to manage the memory for these functions.

The *Store* resource is opaque to the application. The application does not know the structure of the *Store* or how it is implemented. The *Store* is defined as a `void *`. This part of ISO/IEC 8806 defines two new functions which create (in CREATE STORE, bound as `gcreate_store`) and delete (in DELETE STORE, bound as `del_store`) a *Store*.

A *Store* is used by the implementation to manage the memory needed by the functions which return complex data structures. Without specifying an implementation of a *Store*, it is safe to say that it will contain and control memory needed to hold the data returned by these functions and also contain some bookkeeping information about the contents and size of the memory.

The semantics of the *Store* resource provide two levels of memory management. The implementation is responsible for managing the memory at a low level because it uses, reuses, allocates and deallocates memory from the system in order to return information to the application. But the application is ultimately responsible for managing the memory at a high level because it creates and deletes *Stores*.

A *Store* is passed as a parameter to a function returning complex data structures. Another parameter to this function is a pointer to a pointer to a structure which defines the format of the returned data. The *Store* contains memory for the structure and any additional memory referenced by fields within the structure. The application accesses the returned data through its pointer to the structure. It does not use the *Store* to access the data.

A *Store* continues to hold the information from the function until the *Store* is deleted by the DELETE STORE function or until the *Store* is used as an argument to a subsequent function, which returns complex
