Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 3.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 16091 was prepared by the European Committee for Standardization (CEN) in collaboration with Technical Committee ISO/TC 20, *Aircraft and space vehicles*, Subcommittee SC 14, *Space systems and operations*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

Throughout the text of this document, read "this European Standard..." to mean "...this International Standard...".

ISO 16091:2002(E)**Foreword**

This document EN ISO 16091:2002 has been prepared by CMC, in collaboration with Technical Committee ISO/TC 20 "Aircraft and space vehicles".

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by June 2003, and conflicting national standards shall be withdrawn at the latest by June 2003.

The European Standard EN ISO 16091 was prepared by the European Cooperation for Space Standardization (ECSS) Management Standards Working Group for CEN in close collaboration with ISO Technical Committee ISO/TC 20, *Aircraft and space vehicles*, Subcommittee, SC 14, *Space systems and operations*, WG 3, *Operations and ground support*.

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Malta, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom.

<https://standards.iteh.ai/catalog/standards/sist/e5c4124d-123a-4514-b241-6c436a6ba1f1/sist-en-iso-16091-2004>

Introduction

The Integrated Logistic Support (ILS) approach is justified in the space context by improvement of current practices in terms of development of material resources and services essential to support operation and maintenance and to control associated operational risks, particularly in terms of utilization cost and availability.

It is also justified by heightening the awareness of all the programmes and project participants of the need for cost-effective preparation, transfer, and management of information needed to operate, maintain, resupply and dispose of a product. This is as well as ensuring the recording of unscheduled events in order to perform essential support analyses.

The ILS approach differs for different types of space programmes or projects and this International Standard permits appropriate tailoring. Consequently, the requirements in this European Standard are applied at management level, with identification of the objectives to be achieved, rather than with methods and techniques to be implemented to achieve these objectives.

These objectives include:

- a) the participation of the supportability objectives to the system design;
- b) the optimization of the operational and maintenance concepts;
- c) the identification of the required logistic support elements;
- d) the timely delivery of the logistic support elements;
- e) the determination of the system resilience to unscheduled operational events.

Logistic support is not a new activity: its integration into the programme or project is for coordinating, throughout the life cycle, the activities and resources involved in the preparation and optimization of the system and its support elements, aiming at minimum overall life cycle cost, according to the requirements and operational risks.

The advantages and increased efficiency resulting from integrating the logistic support requires that the logistic support functions need to be addressed starting from programme or project definition. It also requires that an integrated approach be established between the design and development of the system and the operational requirements to be fulfilled. This approach is designed to ensure the ability to deliver on time and in proper quantity, material resources and services to deploy, operate, maintain and upgrade the system throughout its utilization phase, within cost requirements, in its operational environment. It also helps to ensure that the capability of the organization and resources dedicated to define, collect, manage and handle the information required to control the logistic support functions throughout the system life cycle from the feasibility phase to the disposal phase are fully developed.

1 Scope

1.1 General

This European Standard describes the set of management requirements needed to identify and provide logistic support, so the customer can operate and maintain a product in its operational environment for the expected lifetime.

These requirements also aim, throughout the product life cycle, at implementing everything pertinent to the control of the risks considered as critical regarding the operational objectives.

The management requirements are applicable to those activities necessary to design, develop, deliver, deploy and manage an organized and structured set of materials and software, services, processes and information dedicated to support the system throughout its life cycle.

This European Standard specifies management, studies, production activities, information management processes and tasks to meet the customer's need for logistic support.

1.2 Tailoring

When viewed from the perspective of a specific programme or project context, the requirements defined in this European Standard should be tailored to match the genuine requirements of a particular profile and circumstances of a programme or project.

NOTE Tailoring is the process by which individual requirements of specifications, standards and related documents are evaluated, and made applicable to a specific programme or project by selection, and in some exceptional cases, modification of existing or addition of new requirements.

3 Terms, definitions and abbreviated terms

3.1 Terms and definitions

For the purposes of this European Standard, the following terms and definitions apply.

3.1.1 availability

the ability of an item to be in a state to perform a required function under given conditions at a given instant of time or over a given time interval, assuming that the required external resources are provided

NOTE 1 This ability depends on the combined aspects of the reliability performance, the maintainability performance and the maintenance support performance.

ISO 16091:2002(E)

NOTE 2 Required external resources, other than maintenance resources do not affect the availability performance of the item.

NOTE 3 In French, the term “disponibilité” is used to denote both the performance and the measure.

NOTE 4 When referring to the measure for "availability", the preferred term is "instantaneous availability".

NOTE 5 Adapted from IEC 60050:(191,603):1992.

3.1.2**configuration**

functional and physical characteristics of a product as defined in technical documents and achieved in the product

[ISO 10007:1995]

3.1.3**customer**

organization or person that receives a product

EXAMPLE Consumer, client, end-user, retailer, beneficiary and purchaser.

NOTE A customer can be internal or external to the organization.

[EN ISO 9000:2000]

3.1.4**data**

information represented in a manner suitable for automatic processing

[IEC 60050:(701,721):1992]

iTeh STANDARD PREVIEW

[SIST EN ISO 16091:2004](https://standards.iteh.ai/catalog/standards/sist/e5c4124d-123a-4514-b241-6c436a6ba1f1/sist-en-iso-16091-2004)

<https://standards.iteh.ai/catalog/standards/sist/e5c4124d-123a-4514-b241-6c436a6ba1f1/sist-en-iso-16091-2004>

3.1.5**dependability**

the collective term used to describe the availability performance and its influencing factors: reliability performance, maintainability performance and maintenance support performance

NOTE Dependability is used only for general descriptions in non-quantitative terms.

[IEC 60050:(191):1992]

3.1.6**document**

a medium and the data recorded on it for human use, for example, a report sheet, a book; by extension, any record that has permanence and that can be read by man or machine

NOTE Where reference is intended only to the carrier medium, the term “document medium” should be used.

[IEEE Std 100 - 1988]

3.1.7**down time**

the time interval during which an item is in a down state

[IEC 60050: (191):1992]
