# Standard Specification and Temperature-Electromotive Force (EMF) Tables for Standardized Thermocouples<sup>1</sup>

This standard is issued under the fixed designation E 230; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon  $(\epsilon)$  indicates an editorial change since the last revision or reapproval.

# 1. Scope

- 1.1 This specification contains reference tables (Tables 8–23) that give temperature-electromotive force (emf) relationships for Types B, E, J, K, N, R, S, and T thermocouples.<sup>2</sup> These are the thermocouple types most commonly used in industry.
- 1.2 Also included are lists of standard and special tolerances on initial values of emf versus temperature for thermocouples (Table 1), thermocouple extension wires (Table 2), and compensating extension wires for thermocouples (Table 3).
- 1.3 Tables 4–5, included herein, give data on insulation color coding for thermocouple and thermocouple extension wires as customarily used in the United States.
- 1.4 Recommendations regarding upper temperature limits for the thermocouple types referred to in 1.1 are given in Table 6.
- 1.5 Tables 24–43 give temperature-emf data for single-leg thermoelements referenced to platinum (NIST Pt 67). The tables include values for Types BP, BN, JP, JN, KP (same as EP), KN, NP, NN, TP, and TN (same as EN).
- 1.6 Tables for Types RP, RN, SP, and SN thermoelements are not included since, nominally, Tables 18–21 represent the thermoelectric properties of Type RP and SP thermoelements referenced to pure platinum.
- 1.7 Polynomial coefficients that may be used for computation of thermocouple emf as a function of temperature are given in Table 7. Coefficients for the emf of each thermocouple pair as well as for the emf of individual thermoelements versus platinum are included.
- 1.8 Coefficients for sets of inverse polynomials are given in Table 44. These may be used for computing a close approximation of temperature (°C) as a function of thermocouple emf. Inverse functions are provided only for thermocouple pairs and are valid only over the emf ranges specified.
  - 1.9 This specification is intended to define the thermoelec-

tric properties of materials that conform to the relationships presented in the tables of this standard and bear the letter designations contained herein. Topics such as ordering information, physical and mechanical properties, workmanship, testing, and marking are not addressed in this specification. The user is referred to specific standards such as Specifications E 235, E 574, E 585, E 608, E 1159, or E 1223, as appropriate, for guidance in these areas.

1.10 The temperature-emf data in this specification are intended for industrial and laboratory use.

- IEC 584-3 First edition, 1989

## 3. Source of Data

- 3.1 The data in these tables are based upon the SI volt<sup>5</sup> and the International Temperature Scale of 1990.
- 3.2 The temperature-emf data in Tables 8–43 and the corresponding equations in Tables 7 and 44 for all of the

 $<sup>^{\</sup>rm 1}$  These tables are under the jurisdiction of ASTM Committee E-20 on Temperature Measurement and are the direct responsibility of Subcommittee E20.04 on Thermocouples.

Current edition approved June 10, 1998. Published March 1999. Originally published as E 230 – 63. Last previous edition E 230 – 96 $^{\epsilon 1}$ .

<sup>&</sup>lt;sup>2</sup> These temperature-emf relationships have been revised as required by the international adoption in 1989 of a revised International Temperature Scale (ITS-90).

<sup>&</sup>lt;sup>3</sup> Annual Book of ASTM Standards, Vol 14.03.

<sup>&</sup>lt;sup>4</sup> Available from National Institute of Standards and Technology, U.S. Department of Commerce, Gaithersburg, MD 20899.

<sup>&</sup>lt;sup>5</sup> Discussed in NIST Technical Note 1263, Guidelines for Implementing the New Representations of the Volt and Ohm Effective January 1, 1990.

thermocouple types have been extracted from NIST Monograph 175.

Note 1—It is beyond the scope of this standard to discuss the origin of these tables, but if further information is desired, the reader should consult the NIST reference noted above.

3.3 These tables give emf values to three decimal places (1  $\mu V)$  at temperature intervals of one degree. Such tables are satisfactory for most industrial uses but may not be adequate for computer and similar applications. If greater precision is required, the reader should refer to the NIST reference noted above which includes tables giving emf values to four decimal places (0.1  $\mu V)$ . Equations which permit easy and unique generation of the temperature-emf relationships will be found in Table 7. For convenience, coefficients of inverse polynomials that may be used to compute approximate temperature (°C) as a function of thermocouple emf are given in Table 44.

# 4. Thermocouple Types and Letter Designations

- 4.1 The letter symbols identifying each reference table are those which are in common use throughout industry and identify the following thermocouple calibrations:
- 4.1.1 *Type B*—Platinum-30% rhodium (+) versus platinum-6 % rhodium (-).
- 4.1.2 *Type E*—Nickel-10 % chromium (+) versus copper-45% nickel (constantan) (–).
- 4.1.3 *Type J*—Iron (+) versus copper-45% nickel (constantan) (–).
- 4.1.4 *Type K*—Nickel-10 % chromium (+) versus nickel-5 % (aluminum, silicon) (–) (Note 2).

Note 2—Silicon, or aluminum and silicon, may be present in combination with other elements.

- 4.1.5 *Type N*—Nickel-14 % chromium, 1½ % silicon (+) versus nickel-4½ % silicon-½ % magnesium (–).
- 4.1.6 *Type R*—Platinum-13 % rhodium (+) versus platinum (-).
- 4.1.7 *Type S*—Platinum-10 % rhodium ( + ) versus platinum (–).
- 4.1.8 *Type T*—Copper (+) versus copper-45% nickel (constantan) (-).
- 4.2 Each letter designation of 4.1 identifies a specific temperature-emf relationship (Tables 8–23) and may be applied to any thermocouple conforming thereto within stated tolerances on initial values of emf versus temperature, regardless of its composition.
- 4.3 The thermoelement identifying symbols in Tables 24 to 43 use the suffix letters P and N to denote, respectively, the positive and negative thermoelement of a given thermocouple type.
- 4.4 Tables 24 to 43 identify specific temperature-emf relationships of individual thermoelements with respect to platinum (NIST Pt-67). Although tolerances on initial values of emf versus temperature, in most cases, are not established for individual thermoelements with respect to platinum, the appropriate letter designation may be applied to any thermoelement which, when combined with its mating thermoelement, will form a thermocouple conforming to the corresponding table within the stated tolerances.

4.5 An overall suffix letter "X" (for example KX, TX, EPX, JNX) denotes an "extension grade" material whose thermoelectric properties will match those of the corresponding thermocouple type within the stated extension grade tolerances over a limited temperature span. Most base metal extension wires have the same nominal composition as the thermocouple wires with which they are intended to be used, whereas the *compensating* extension wires for noble metal thermocouple types (S, R, or B) are usually of a different, more economical composition whose properties nonetheless closely approximate those of the precious metal thermocouples with which they are to be used.

# 5. Tolerances on Initial Values of EMF versus Temperature

- 5.1 Thermocouples and matched thermocouple wire pairs are normally supplied to the tolerances on initial values of emf versus temperature listed in Table 1.
- 5.1.1 Tolerances on initial values of emf versus temperature for single-leg thermoelements referenced to platinum have been established only for Types KP and KN. These are supplied, by common practice, to a tolerance equivalent to one half the millivolt tolerance of the Type K thermocouple.
- 5.1.2 For all other thermocouple types, tolerances on initial values of emf versus temperature for single thermoelements, when required, should be established by agreement between the consumer and the producer.
- 5.1.3 In reference Tables 32, 33, 42, and 43, the thermoelements are identified by two thermoelement symbols indicating their applicability to two thermocouple types. This indicates that the temperature-electromotive force relationship of the table is typical of the referenced thermoelements over the temperature range given in Table 1 for the corresponding thermocouple type. It should not be assumed, however, that thermoelements used with one thermocouple type are interchangeable with those of the other, or that they have the same millivolt tolerances for the initial values of emf versus temperature.
- 5.2 Thermocouple extension wires and compensating extension wires are supplied to the tolerances on initial values of emf versus temperature shown in Tables 2–3.
- 5.2.1 The initial tolerances of extension grade materials and compensating extension materials apply over a more limited span of temperature than the corresponding thermocouple grade materials. Applicable temperature ranges, consistent with typical usage, are given in Tables 2–3.

# 6. Color Coding

- 6.1 Color codes for insulation on thermocouple grade materials, along with corresponding thermocouple and thermoelement letter designations, are given in Table 4.
- 6.2 Extension wires for thermocouples are distinguished by having an identifying color in the outer jacket as shown in Table 5, where letter designations for the extension thermoelements and pairs are also presented.
- 6.3 Information in Tables 4–5 is based on customary United States practice.

Note 3—Other insulation color coding conventions may be found in use elsewhere in the world.

#### 7. List of Tables

7.1 Following is a list of the tables included in this standard:

## 7.1.1 General Tables:

| Title  |

## 7.1.3 *EMF versus Temperature Tables for Thermoelements*:

| Table Number | Thermocouple Type | Thermoele-<br>ment Type | Temperature<br>Range <sup>A</sup> |
|--------------|-------------------|-------------------------|-----------------------------------|
| 24           | В                 | BP                      | 0 to 1768°C                       |
| 25           | В                 | BP                      | 32 to 3214°F                      |
| 26           | В                 | BN                      | 0 to 1768°C                       |
| 27           | В                 | BN                      | 32 to 3214°F                      |
| 28           | J                 | JP                      | -210 to 760°C                     |
| 29           | J                 | JP                      | -346 to 1400°F                    |
| 30           | J                 | JN                      | -210 to 760°C                     |
| 31           | J                 | JN                      | -346 to 1400°F                    |
| 32           | K or E            | KP or EP                | -270 to 1372°C                    |
| 33           | K or E            | KP or EP                | -454 to 2500°F                    |
| 34           | K                 | KN                      | -270 to 1372°C                    |
| 35           | K                 | KN                      | -454 to 2500°F                    |
| 36           | N                 | NP                      | -200 to 1300°C                    |
| 37           | N                 | NP                      | -328 to 2372°F                    |
| 38           | N                 | NN                      | -200 to 1300°C                    |
| 39           | N                 | NN                      | -328 to 2372°F                    |
| 40           | T                 | TP                      | -270 to 400°C                     |
| 41           | T                 | TP                      | -454 to 752°F                     |
| 42           | T or E            | TN or EN                | -270 to 1000°C                    |
| 43           | T or F            | TN or FN                | -454 to 1832°F                    |

<sup>&</sup>lt;sup>A</sup> These temperature ranges represent the range of published temperature versus emf data for the thermocouple and thermoelement types listed. Refer to Table 6 for recommended maximum upper use temperature limits for a specific thermocouple wire size and type.

## 7.1.4 Supplementary Table:

| Table<br>Number | S  |

8.1 emf computation; compensating extension wire; inverse polynomial; polynomial coefficient; reference tables; thermocouple; thermocouple extension wire; thermoelement; upper temperature limit

# **APPENDIX**

(Nonmandatory Information)

# X1. IEC COLOR CODE SYSTEM

# X1.1 General

X1.1.1 The data presented in Tables 4–5 of this specification show the color coding required by this specification. Those colors are well established in the United States and have been in use as the national standard there for many years.

X1.1.2 In other parts of the world, there are alternative color

code systems, either now in use, or in process of being implemented.

X1.1.3 One such color code system is that established by the IEC. The IEC color code system is outlined here for reference. Table X1.1 shows the IEC standard colors for thermocouple cables, extension cables, and compensating cables.

## TABLE 1 Tolerances on Initial Values of Emf vs. Temperature for Thermocouples

Note 1—Tolerances in this table apply to new essentially homogeneous thermocouple wire, normally in the size range 0.25 to 3 mm in diameter (No. 30 to No. 8 Awg) and used at temperatures not exceeding the recommended limits of Table 6. If used at higher temperatures these tolerances may not apply.

Note 2—At a given temperature that is expressed in °C, the tolerance expressed in °F is 1.8 times larger than the tolerance expressed in °C. Note that wherever applicable, percentage-based tolerances must be computed from temperatures that are expressed in °C.

Note 3—Caution: Users should be aware that certain characteristics of thermocouple materials, including the emf versus temperature relationship may change with time in use; consequently, test results and performance obtained at time of manufacture may not necessarily apply throughout an extended period of use. Tolerances given in this table apply only to new wire as delivered to the user and do not allow for changes in characteristics with use. The magnitude of such changes will depend on such factors as wire size, temperature, time of exposure, and environment. It should be further noted that due to possible changes in homogeneity, attempting to recalibrate used thermocouples is likely to yield irrelevant results, and is not recommended. However, it may be appropriate to compare used thermocouples in-situ with new or known good ones to ascertain their suitability for further service under the conditions of the comparison.

| Temperature Range |             |                           | Tolerances-Reference Junction 0°C (32°F) |                           |                          |        |  |
|-------------------|-------------|---------------------------|--|---------------------------|--------------------------|--------|--|
| Thermo-<br>couple |             |                           | Standard Tolera                          | nces                      | Special Tolerances       |        |  |
| Type °C           | °F          | °C (whichever is greater) | °F                                       | °C (whichever is greater) | °F                       |        |  |
| T                 | 0 to 370    | 32 to 700                 | ±1 or ±0.75 %                            | Note 2                    | ±0.5 or 0.4 %            | Note 2 |  |
| J                 | 0 to 760    | 32 to 1400                | $\pm 2.2$ or $\pm 0.75$ %                |                           | ±1.1 or 0.4 %            |        |  |
| E                 | 0 to 870    | 32 to 1600                | $\pm 1.7$ or $\pm 0.5$ %                 |                           | $\pm 1$ or $\pm 0.4$ %   |        |  |
| K or N            | 0 to 1260   | 32 to 2300                | $\pm 2.2$ or $\pm 0.75$ %                |                           | $\pm 1.1$ or $\pm 0.4$ % |        |  |
| R or S            | 0 to 1480   | 32 to 2700                | ±1.5 or ±0.25 %                          |                           | $\pm 0.6$ or $\pm 0.1$ % |        |  |
| В                 | 870 to 1700 | 1600 to 3100              | ±0.5 %                                   |                           | ±0.25 %                  |        |  |
| $T^A$             | -200 to 0   | -328 to 32                | ±1 or ±1.5 %                             |                           | В                        |        |  |
| $E^A$             | -200 to 0   | -328 to 32                | ±1.7 or ±1 %                             |                           | В                        |        |  |
| $K^A$             | -200 to 0   | -328 to 32                | ±2.2 or ±2 %                             |                           | В                        |        |  |

A Thermocouples and thermocouple materials are normally supplied to meet the tolerances specified in the table for temperatures above 0 °C. The same materials, however, may not fall within the tolerances given for temperatures below °C in the second section of the table. If materials are required to meet the tolerances stated for temperatures below 0 °C the purchase order must so state. Selection of materials usually will be required.

Type E – 200 to 0 °C  $\pm$  1 °C or  $\pm$  0.5 % (whichever is greater)

Type T – 200 to 0 °C  $\pm$  0.5 °C or  $\pm$  0.8 % (whichever is greater)

Initial values of tolerance for Type J thermocouples at temperatures below 0 °C and special tolerances for Type K thermocouples below 0 °C are not given due to the characteristics of the materials.

# TABLE 2 Tolerances on Initial Values of Emf vs. Temperature for Extension Wires 459 Mastin - 6230-98

Note 1—Tolerances in this table represent the maximum error contribution allowable from new and essentially homogeneous thermocouple extension wire when exposed to the full temperature range given in the table below. Extension grade materials are not intended for use outside the temperature range shown

Note 2—Thermocouple extension wire makes a contribution to the total thermoelectric signal that is dependent upon the temperature difference between the extreme ends of the extension wire length. The actual magnitude of any error introduced into a measuring circuit by homogeneous and correctly connected extension wires is equal to the algebraic difference of the deviations at its two end temperatures, as determined for that extension wire pair.

<sup>&</sup>lt;sup>B</sup>Special tolerances for temperatures below 0 °C are difficult to justify due to limited available information. However, the following values for Types E and T thermocouples are suggested as a guide for discussion between purchaser and supplier:

## TABLE 3 Tolerances on Initial Values of Emf vs. Temperature for Compensating Extension Wires

Note 1—Tolerances in this table apply to new and essentially homogeneous thermocouple compensating extension wire when used at temperatures within the range given in the table below.

Note 2—Thermocouple compensating extension wire makes a contribution to the total thermoelectric signal that is dependent upon the temperature difference between the extreme ends of the compensating extension wire length.

|                   |          |             | Toleran  | ces—Reference Junction | 0°C (32°F)         |
|-------------------|----------|-------------|----------|------------------------|--------------------|
| Thermocouple      | Temperat | ture Range  | Standard | Tolerances             | Special Tolerances |
| Туре              | °C       | (°F)        | °C       | (°F)                   |                    |
| SX                | 0 to 200 | (32 to 400) | ±5       | (±9)                   | A                  |
| RX                | 0 to 200 | (32 to 400) | ±5       | (±9)                   | A                  |
| $BX^B$            | 0 to 200 | (32 to 400) | ±4.2     | (±7.6)                 | A                  |
| $B^{\mathcal{C}}$ | 0 to 100 | (32 to 200) | ±3.7     | (±6.7)                 |                    |

<sup>&</sup>lt;sup>A</sup> Special tolerance grade compensating extension wires are not available.

## TABLE 4 United States Color Codes for Single and Duplex Insulated Thermocouple Wire

Note 1—Data in this table represents customary practice in the United States of America. Different color code conventions may be found in use in other parts of the world.

Note 2—For some types of insulations, colors may appear as a stripe or trace strand. High temperature braided insulation is not normally color coded.

Note 3—The noble metal thermocouples are not normally supplied with colored insulations. However, if they were so furnished, the color codes for the corresponding single wire extensions would apply, with a brown overall jacket, where applicable.

| Thermocouple Type | Thermoelement Designation              | Individual Conductor Color    | Overall Jacket Color |

|                   | NN (-)                                 | Red                           |                      |

<sup>&</sup>lt;sup>B</sup> Proprietary alloy compensating extension wire is available for use over a wide temperature range.

<sup>&</sup>lt;sup>C</sup> Special compensating extension wires are not necessary with Type B over the limited temperature range 0 to 50 °C (32 to 125 °F), where the use of non-compensated (copper/copper) conductors introduces no significant error. For a somewhat larger temperature gradient of 0 to 100 °C (32 to 210 °F) across the extension portion of the circuit, the use of non-compensated (copper/copper) extension wires may result in small errors, the magnitude of which will not exceed the tolerance values given in the table above for measurements above 1000 °C (1800 °F).

## TABLE 5 United States Color Codes for Single and Duplex Insulated Extension Wire

Note 1—Data in this table represents customary practice in the United States of America. Different color code conventions may be found in use in other parts of the world.

Note 2—For some types of insulations, colors may appear as a stripe or trace strand. High temperature braided insulations are normally supplied without color code.

| Thermocouple Type     | Thermoelement Designation | Individual Conductor Color | Overall Jacket Color |

|                       | BPX (+)                   | Gray                       |                      |
|                       | BNX (-)                   | Red, or Red/Gray Trace     |                      |

<sup>&</sup>lt;sup>A</sup> Type R and S thermocouples utilize the same extension alloys.

## TABLE 6 Suggested Upper Temperature Limits for Protected Thermocouples

Note 1—This table gives the recommended upper temperature limits for the various thermocouples and wire sizes. These limits apply to protected thermocouples, that is, thermocouples in conventional closed-end protecting tubes. They do not apply to sheathed thermocouples having compacted mineral oxide insulation.

Note 2—The temperature limits given here are intended only as a guide to the user and should not be taken as absolute values nor as guarantees of satisfactory life or performance. These types and sizes are sometimes used at temperatures above the given limits, but usually at the expense of stability or life or both. In other instances, it may be necessary to reduce the above limits in order to achieve adequate service. ASTM MNL-12<sup>A</sup> and other literature sources should be consulted for additional applications information.

<sup>&</sup>lt;sup>A</sup> Manual on the Use of Thermocouples in Temperature Measurement, ASTM MNL-12, 1993.

<sup>&</sup>lt;sup>B</sup> Color code shown is applicable to constructions incorporating proprietary Type B compensating extension alloy wires. When uncompensated (copper/copper) extension materials are used with Type B thermocouples, the extension wire insulation is not normally color coded.

# TABLE 7 Polynomial Coefficients for Generating Thermocouple EMF as a Function of Temperature

Note—The following table contains sets of polynomial coefficients used to compute emfs for the various types of thermocouples and for their individual thermoelements paired with Pt-67, when reference junctions are at °C.

Note—The coefficients given are for an expession of the form:  $E = c_0 + c_1 t + c_2 t^2 + c_3 t^3 ... + c_n t^n$ . In this expression, E is in millivolts, t is in °C, and  $c_0$ ,  $c_1$ ,  $c_2 ... c_n$  are the coefficients given in the following table. For the Type K thermocouple and the Type KN thermoelement, coefficients  $b_0$  and  $b_1$  for an exponential term containing e, the natural logarithm base, also appear in the table. This term is of the form:  $b_0 e b_{1(t-126.9686)2}$  and, where given, it is to be evaluated and added to the polynomial result.

Note—If emf values on another temperature scale are desired, first convert the desired temperature to its equivalent in °C, then evaluate the appropriate polynomial from the table below using the °C equivalent temperature
