

GUIDE 53

An approach to the utilization of a supplier's quality system in third party product certification

iTeh STANDARD PREVIEW (standards.iteh.ai)

ISO/IEC Guide 53:1988 https://standards.iteh.ai/catalog/standards/sist/ac957f56-be16-43f1-a959-9428386b6730/iso-iec-guide-53-1988

Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) together form a system for worldwide standardization as a whole. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

This Guide was drawn up by the ISO Committee on conformity assessment, ISO/CASCO. It was approved by the IEC Council in August 1988 and by the ISO Council in September 1988.

While this emphasis on creating the infrastructure for mutual recognition covers most of the work of ISO/CASCO, notice has to be taken that a further objective is to create the basis for an international certification system in due course, if found to be required. Some ISO/CASCO documents relate to the development of rules for such a system.

It is recognized that there are already well established certification systems, e.g. in the electrotechnical field, which have been developed with the aim of facilitating trade and which are functioning satisfactorily in the spirit of relevant ISO/IEC Guides.

in August 1988 and by the ISO Council in September 1988.

The documents produced by CASCO are issued as Guides and ards.iteh.ai) follow the general rules for development and promulgation of ISO and IEC standards except that they are the result of a context Guide 53:1988 sensus reached within a Council committee, endorsed by the ISO Council and the IEC Council.

9428386b6730/iso-iec-guide-53-1988

The work of ISO/CASCO in preparing Guides relating to certification, assessment and testing, uses as a basis the principles established in ISO/IEC Guide 16, Code of principles on third party certification systems and related standards.

Guide 16 recognizes that third party certification systems should, to the extent possible, be based on internationally agreed standards and procedures. While recognizing the major role of manufacturers' declaration of conformity through normal manufacturer/customer relationship, Council resolutions have emphasized the preparation of guidance documents on third party certification and assessment procedures in order that national systems may be compatible with one another so as to facilitate bilateral and multilateral agreements.

Whilst these documents are intended to provide guidance, it is hoped that any changes from the documents made in introducing systems nationally would be minimal. In recognizing that some countries may choose to adopt the Guides directly, they are written to enable this to be done by including words such as "shall" to indicate those aspects which desirably would be mandatory. The overriding basis that the document is intended to provide guidance holds good.

International Organization for Standardization, 1988

Printed in Switzerland

Introduction

Certification programmes 1) utilizing elements of a supplier's quality assurance system can be very effective for both the supplier and the certification body in achieving certification in a timely and cost-effective manner and in assuring that products continuously conform to standards.

The process involves close collaboration between a third party certification body and suppliers in the industry sector for whose products the programme was developed. This collaboration involves using prescribed elements of the supplier's quality assurance system under a qualification and certifier audit procedure to fulfil some needs of the certification programme, RD PREVIEW with all remaining needs being provided by the third party certification body. The quality system elements selected may be ds.iteh.ai) drawn from one or more standards which detail differing levels of quality systems.

ISO/IEC Guide 53:1988

Certification programmes can take many forms including some dards/sist/ac957f56-be16-43f1-a959that do not utilize a supplier's quality assurance capability so-iec-guide-53-1988 There is no inference in this Guide that one form of certification programme is superior to another. Further, when a certification body has several forms of certification programmes available for a class of product, the supplier must have the right to choose the form of programme under which he wishes to apply for certification.

This Guide is based on the understanding that persons using it to develop certification programmes are familiar with the principles and practices covered by the ISO 9000 series of International Standards and/or other appropriate standards on quality systems. The elements selected from these standards should be tailored to meet the specific needs of the certification programme. It is also understood that persons using this Guide will be familiar with and utilize, in addition to the programme aspects described herein, the specific product standard(s) involved and the more general certification and follow-up provisions such as those contained in ISO/IEC Guide 28.

¹⁾ The term "certification programme" is used here to cover the same concept as "certification scheme" (ISO/IEC Guide 2, definition 14.2).

ISO/IEC Guide 53:1988 https://standards.iteh.ai/catalog/standards/sist/ac957f56-be16-43f1-a959-9428386b6730/iso-iec-guide-53-1988

An approach to the utilization of a supplier's quality system in third party product certification

Scope

- This Guide outlines a general approach by which certification bodies wishing to do so can develop and apply product certification programmes utilizing elements of suppliers' quality systems.
- 1.2 The forms of programmes espoused by this Guide are for conformity certification of products only and in all cases involve the following as principles:
 - a) assessment of a supplier's capability to manufacture consistently a product conforming to the relevant standard(s):
 - b) testing or comparable evaluation of the product to the satisfaction of the certification body to determine compliance with the requirements of the standard;
 - c) application of a suitable follow-up derivice/totassure dards 3 st/Definitions 43f1-a959ongoing conformity of products manufactured by the supriso-jec-guide-53-1988

 nlier: The relevant definitions of ISO/IEC Guide 2 apply. In addition,
 - d) control of the mark and/or name of the certification body.
- 1.3 Within certification programmes it is possible for third party certification bodies to develop a variety of certification procedures to meet the needs of suppliers having a wide range of quality assurance capabilities. Those suppliers with the least demonstrated capabilities in this regard could be involved in certification procedures where the greatest number of steps in the total certification programme would be carried out by the certification body. Those suppliers with highly developed quality systems could process a large number of the steps required by the certification programme under a system of ongoing auditing by the certification body. Whatever the form of programme that is developed, the certification body reserves the authority to certify or not to certify any product manufactured by the supplier. A certification body may at its discretion specify programme criteria in addition to those described herein.

for the purposes of this Guide, the following definition applies.

supplier: The party that is responsible for the product, process or service and is able to ensure that quality assurance is exercised. The definition may apply to manufacturers, distributors, importers, assemblers, service organizations, etc.

Steps in developing a programme

4.1 Deciding on the form of programme

The programme is developed by the certification body to meet the needs of individual suppliers, a certain sector of industry or several industry sectors which have reached an acceptable level in their knowledge and application of quality assurance practices.

The elements of the quality system practices commonly employed within the industry sector are examined and those elements which can be applied to achieve the needed certification programme are incorporated into the programme criteria.

NOTE — Information on the elements of quality systems can be found in the ISO 9000 series or in similar national documents of some countries.

4.2 The three phases in the implementation of a certification programme

All forms of product certification programmes within the scope of this Guide consist of the following three phases:

- qualification;
- certification;
- follow-up.

5 The qualification phase

- In this phase the supplier is assessed to see if he qualifies in meeting all parts of the certification process which he is required to fulfil under the particular certification programme.
- **5.2** To facilitate the assessment, a programme data form is developed which contains pertinent information needed to be acquired from the applicant. Two examples of such forms, one fairly simple and one more complex, with regard to the number of quality system elements involved in the programme, are shown in annexes A and B.
- **5.3** Depending upon the nature of the programme being developed and the degree to which the programine will utilize ards.iteh.ai) supplier's quality system, the certification body may require a supplier to have a minimum level of successfully demonstrated product certification under the programme.
- **5.4** An applicant completes the form and returns it to the certification body. An evaluation of the responses provides an excellent indication of whether or not the applicant is likely to qualify as a programme participant. Clarifications required by either party are obtained by the quickest available form of communication.
- **5.5** Following clarifications, a date is arranged for a visit to the applicant's plant. The certification body's assessement team should contain persons knowledgeable in
 - the applicable product standard(s);
 - appropriate laboratory procedures and techniques; b)
 - assessment procedures;
 - the quality system elements included in the programme.
- 5.6 The matters to be investigated by the assessment team at the supplier's plant will vary widely depending upon the degree to which the supplier is to be involved in the certification process. Normally, however, the assessment team shall take the following actions:
 - a) in general, ascertain that all information provided in the programme data form is correct;

- b) check to ensure that the supplier has the necessary equipment, staff and facilities for carrying out the tasks assigned to him for his participation in the certification programme;
- c) have the supplier demonstrate his capability to test samples so as to assure conformity with the specific product standard(s) used in the programme; this may involve verification of test results by the certification body;
- d) ensure that those quality elements that must be carried out by the supplier as part of the certification programme are being properly performed; also, that the necessary safeguards to ensure that they will continue to be properly performed are in place.
- **5.7** Following the visit to the factory by the certification body's assessment team, a report on the team's findings is prepared and submitted together with the completed application to the responsible persons or group in the certification body to determine whether and under what conditions the applicant may be qualified. If the information is found to be complete and acceptable, the applicant is so informed in writing.
- 5.8 A supplier can be qualified for additional product categories only after another assessment specifically directed to the new product category has been successfully completed.
- 5.9 All the facilities involved in the process of developing a experience with the certification body in the production of conc Guid product covered under a certification programme, whether part forming products before the supplier/is petmitted to apply for and ar of the Supplier is or gant at it is petmitted to apply for and ar of the Supplier is or not, must be evaluated by 9428386b6730/iso-jerepresentatives of the certification body.

The certification phase

- **6.1** The action to be taken for certification will depend upon the type of programme developed. Following the qualification phase, the supplier may, for example, need to apply for certification each time he desires a new product to be certified. The certification process will then be implemented as described in the programme and the prescribed elements of the supplier's quality system will be included in that process. See also clause 7c).
- **6.2** As a first example, a simple procedure may be based only upon acceptance of test data generated by the supplier's laboratory, i.e. only those elements required for assessment of the supplier's testing facilities and practices are involved in the qualification (see annex A). In such a case, after its qualification the laboratory would be visited by a representative of the certification body to
 - a) witness all types of tests; or
 - witness some types of tests; or
 - review the supplier's test results;

and if found to be in order, to accept them.

- **6.3** As a second example (see annex B), following a qualification phase which involves assessment of a large number of the elements of a supplier's quality system and of all the other requirements of the certification programme, the supplier is permitted to apply the certification body's mark to certain categories of products under an ongoing follow-up phase.
- **6.4** The examples given in annexes A and B are illustrative of programmes which utilize (A) very few elements, and (B) many elements of the supplier's quality system. In addition to these examples, there are many different combinations of elements possible which a certification body may decide to employ in order to meet different needs.

7 The follow-up phase

This phase is designed to provide a means for assuring those who rely on the certification mark that products, once certified, and for the subsequent period of time that the supplier applies the certification body's mark to the products, continue to meet the requirements of the applicable product standards. Involved in this phase is an ongoing, in plant, working relationship between staff of the certification body and staff of the supplier. Details of the follow-up inspection will vary with the needs of the type of programme being developed. However the following general principles always apply.

a) In carrying out follow-up inspection at the supplier's US. I plant, a representative of the certification body ensures that all quality system elements prescribed in the programme are cuide 53

being adhered to and, in general, satisfies himself that the product covered by the programme continues to conform to the product standard. Normally this would also include witnessing some selected tests, examination of quality assurance records and examination of products to determine compliance with requirements.

- b) During a follow-up inspection, discussion shall take place concerning the test programme as it relates to new products within the authorized product category to be evaluated prior to the next inspection visit. When such discussion pertains to authorization to apply the mark or other evidence of certification of the certification body to new or revised products, the inspection team shall be composed of individuals who normally make such decisions within the certification body.
- c) Labels or other evidence of certification shall not be applied to a design or construction which, in the opinion of the inspection team, could produce non-conformance until the evidence of compliance has been accepted by the certification body.
- d) The minimum frequency of follow-up visits is prescribed in the programme. Follow-up will take place at all locations covered by the programme. For example, if products are manufactured at a different location from that at which the products are designed, tested and evaluated, and all these elements are part of the programme, follow-up will cover all relevant locations.
- e) Records shall be kept by the certification body of all models of products certified.

Annex A

Example of a programme data form in a case involving very few elements of a supplier's quality system

Introductory note (not part of the programme data form)

This is an example of a certification body's programme data form for a supplier who requests certification under a programme which has been developed to make use of the supplier's testing laboratory for generating some or all of the test data required to indicate compliance with the tests called for by the applicable standard(s).

The supplier's quality system elements to be assessed by the certification body under this programme are

- measuring and testing equipment;
- product testing and measurement.h STANDA

The assessment by the certification body of the supplier's ITCLS. quality system involves such items as

- the Quality Manual for the laboratory operations;
 https://standards.iteh.ai/catalog/standards
- limits of accuracy of all measuring and test equipment ()/iso-iec-guide-53-1988.
 involved;
- the environment in which the calibrations are performed;
- the environment in which the testing is performed:
- the methods of measurement and test;

- the availability of appropriate instrumentation and testing equipment;
- -- adequacy of energy supplies to perform required testing;
- the supplier's equipment calibration programme;
- demonstration of ability to conduct tests in accordance with prescribed standards and the practices of the certification body.

During the qualification phase, other matters of concern to the certification body include

- a) establishing the designated person and deputy to be responsible for all dealings with the certification body;
- b) ascertaining the supplier's knowledge of the applicable ISO/IEC Guide 5standards and how this knowledge is maintained on an actalog/standards/songeing/pasis; 16-43fl-a959
 - the experience and qualification of all personnel testing products, including their capability to perform tests in accordance with the techniques and procedures prescribed and/or used by the certification body.

Information pertaining to all of the above items is sought via the programme data form (see example on the following page).

Programme data form (Specimen)

Annex B

Example of a programme data form in a case involving many elements of a supplier's quality system

Introductory note (not part of the programme data form)

This is an example of a certification body's programme data form for a supplier (electrical supplier in this case) who requests certification under a programme which has been developed to make use of a large number of the elements of a supplier's quality system. The elements involved in this programme include the following: measuring and testing equipment, quality records, nonconformances, customer-supplied items, inspection and test, document control, identification and traceability, purchasing, manufacturing and construction, corrective action, design assurance.
