About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

IEC Catalogue - webstore.iec.ch/catalogue

The stand-alone application for consulting the entire bibliographical information on IEC International Standards, Technical Specifications, Technical Reports and other documents. Available for PC, Mac OS, Android Tablets and iPad.

IEC publications search - www.iec.ch/searchpub

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and also once a month by email.

Electropedia - www.electropedia.org

The world's leading online dictionary of electronic and electrical terms, containing 20 000 terms and definitions in English and French, with equivalent terms in 16 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

65 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: csc@iec.ch.

A propos de l'IEC

La Commission Electrotechnique Internationale (IEC) est la première organisation mondiale qui élabore et publie des Normes internationales pour tout ce qui a trait à l'électricité, à l'électronique et aux technologies apparentées.

A propos des publications IEC

Le contenu technique des publications IEC est constamment revu. Veuillez vous assurer que vous possédez l'édition la plus récente, un corrigendum ou amendement peut avoir été publié.

Catalogue IEC - webstore.iec.ch/catalogue

Application autonome pour consulter tous les renseignements bibliographiques sur les Normes internationales, Spécifications techniques, Rapports techniques et autres documents de l'IEC. Disponible pour PC, Mac OS, tablettes Android et iPad.

Recherche de publications IEC - www.iec.ch/searchpub

La recherche avancée permet de trouver des publications IEC en utilisant différents critères (numéro de référence, texte, comité d'études,...). Elle donne aussi des informations sur les projets et les publications remplacées ou retirées.

IEC Just Published - webstore.iec.ch/justpublished

Restez informé sur les nouvelles publications IEC. Just Published détaille les nouvelles publications parues. Disponible en ligne et aussi une fois par mois par email.

Electropedia - www.electropedia.org

Le premier dictionnaire en ligne de termes électroniques et électriques. Il contient 20 000 termes et définitions en anglais et en français, ainsi que les termes équivalents dans 16 langues additionnelles. Egalement appelé Vocabulaire Electrotechnique International (IEV) en ligne.

Glossaire IEC - std.iec.ch/glossary

65 000 entrées terminologiques électrotechniques, en anglais et en français, extraites des articles Termes et Définitions des publications IEC parues depuis 2002. Plus certaines entrées antérieures extraites des publications des CE 37, 77, 86 et CISPR de l'IEC.

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 60287-2-3 has been prepared by IEC technical committee 20: Electric cables.

The text of this International Standard is based on the following documents:

FDIS	Report on voting
20/1707/FDIS	20/1720/RVD

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 60287 series, published under the general title *Electric cables – Calculation of the current rating*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

[IEC 60287-2-3:2017](https://standards.iteh.ai/catalog/standards/sist/704aa0c5-9155-4ecc-8cb5-518591976cf4/iec-60287-2-3-2017)

<https://standards.iteh.ai/catalog/standards/sist/704aa0c5-9155-4ecc-8cb5-518591976cf4/iec-60287-2-3-2017>

INTRODUCTION

In the IEC 60287 series, IEC 60287-1 provides general formulae for ratings and power losses of electric cables.

IEC 60287-2 presents formulae or calculation methods for thermal resistances.

IEC 60287-2-1 provides calculation methods for dealing with cables installed in free air (see IEC 60287-2-1:2015,4.2.1).

IEC 60287-2-2 provides a method and data for calculating reduction factors for cables in groups running horizontally in free air.

IEC 60287-2-1 and IEC 60287-2-2 consider heat transfer only in a plane perpendicular to the cables; they assume there is no longitudinal heat transfer.

This part of IEC 60287 deals with the rating for cables installed in ventilated tunnels. In such situations, consideration of longitudinal temperature gradients is involved as the air flowing in the tunnel removes some heat from the cables.

Heat transfer with the moving air is convective and is assumed to be either laminar or turbulent depending on the air velocity. The transition situation between laminar and turbulent air flows is ignored.

iTeh STANDARD PREVIEW

A general simplified method is provided to estimate the permissible current-carrying capacity of cables installed in ventilated tunnels, the ventilation being either natural or forced.

Only steady states are considered, where the inlet air temperature and the cable loading are constant for a sufficient time for steady temperatures to be achieved.

Where multiple circuits are involved, their characteristics are assumed to be identical.

The main features of the calculation method for cables in tunnels with forced ventilation can be found in Electra n°143 – 144 (1992)[1]¹, as the report of a CIGRE working group, including the erratum in Electra n°209 (2003).

¹ Numbers in square brackets refer to the Bibliography.

ELECTRIC CABLES – CALCULATION OF THE CURRENT RATING –

Part 2-3: Thermal resistance – Cables installed in ventilated tunnels

1 Scope

This part of IEC 60287 describes a method for calculating the continuous current rating factor for cables of all voltages installed in ventilated tunnels. The method is applicable to any type of cable.

The method applies to natural as well as forced ventilation.

Longitudinal heat transfer within the cables and the surroundings of the tunnel is assumed to be negligible.

All cables are assumed to be identical within the tunnel and it is assumed that the tunnel cross-section does not change with distance along the tunnel.

2 Normative references

$\theta_s(z)$	temperature of the cable surface, at the point z in the cable route	°C
$\theta_s(L)$	temperature of the cable surface, at tunnel outlet	°C
$\theta_t(z)$	temperature of the inner tunnel wall, at the point z in the cable route	°C
$\theta_t(L)$	temperature of the inner tunnel wall, at tunnel outlet	°C
θ_a	temperature at ground level	°C

4 Description of method

4.1 General description

The method is based on the calculation of the temperature of the cable surface, the air in the tunnel and the tunnel wall, as a function of the heat generated by the cables.

For any location along the cable route, a set of formulae is developed, involving:

- heat transfer formulae describing heat transfer mechanisms by radiation and convection between the cables, the air in the tunnel and the tunnel wall;
- energy balance formulae for cables, air in the tunnel and tunnel wall;
- heat transfer formulae for conduction in the surroundings of the tunnel.

This set of formulae may be written in such a way that:

- the heat removed by the air, $W_a(z)$, is linked to the derivative of the air temperature with respect to the longitudinal coordinate of the tunnel;
- every other formula is approximated as a thermal Ohm's law linking temperature drop and heat flow through a thermal resistance; the heat flow is derived from the heat generated by the cables, W_k , and the heat removed by the air, $W_a(z)$.

Some of the thermal resistances depend on the air temperature and consequently on the distance along the tunnel.

This may be dealt with by dividing the tunnel route into elementary lengths, so that:

- the heat removed by the air is proportional to the difference in the air temperature between elementary length outlet and inlet;
- the thermal resistances may be considered constant for the elementary length.

For typical installations considered in the CIGRE work [1], it was recognized that assuming constant thermal resistances along the tunnel route, computed using temperatures at the tunnel outlet, does not lead to a serious error.

With this assumption, solving the set of formulae is straightforward and the temperatures of the cable surface, air and tunnel wall are easily derived as a function of the cable losses.

The permissible current is then derived from the heat transfer formula for conduction within the cable linking the temperature drop between the conductor and the cable surface to the losses in the cables.

As temperatures at the tunnel outlet are not known, an iterative process is necessary.

The heat generated by a cable, W_k , is assumed to be constant along the cable route and is calculated for the maximum permissible conductor temperature, leading to an estimate of the current rating that is on the safe side.

$$W_k = n \cdot [W_c \cdot (1 + \lambda_1 + \lambda_2) + W_d] \quad (1)$$

$$W_c = R \cdot I^2 \quad (2)$$

where

W_k is the total heat generated by a cable (W/m);

n is the number of conductors in a cable;

W_c is the losses in a conductor per unit length, assuming maximum conductor temperature (W/m);

λ_1 is the ratio of the total losses in metallic sheaths to the total conductor losses;

λ_2 is the ratio of the total losses in armour to the total conductor losses;

W_d is the dielectric losses per unit length per phase (W/m);

R is the alternating current resistance of conductor at its maximum operating temperature (Ω/m);

I is the current in one conductor (r.m.s. value) (A).

iTech STANDARD PREVIEW
(standards.iteh.ai)

4.2 Basic formulae

4.2.1 General

[IEC 60287-2-3:2017](#)

[https://standards.iteh.ai/catalog/standards/sist/704aa0c5-9155-4ecc-8cb5-](https://standards.iteh.ai/catalog/standards/sist/704aa0c5-9155-4ecc-8cb5-318591970c44/iec-60287-2-3-2017)

The following heat transfer mechanisms are taken into account:

- radial heat transfer by conduction within the cable,
- heat transfer by radiation from the cable surface to the tunnel wall,
- heat transfer by convection from the cable surface to the air inside the tunnel,
- heat transfer by convection from the air inside the tunnel to the tunnel wall,
- longitudinal heat transfer by convection resulting from the forced or natural flow of air along the tunnel.

4.2.2 Radial heat transfer by conduction within the cable

The conductor temperature is derived from the formula given in IEC 60287-1-1.

$$\theta(z) = \theta_s(z) + W_c \cdot [T_1 + n \cdot (1 + \lambda_1) \cdot T_2 + n \cdot (1 + \lambda_1 + \lambda_2) \cdot T_3] + W_d \cdot \left[\frac{T_1}{2} + n \cdot (T_2 + T_3) \right] \quad (3)$$

where

$\theta(z)$ is the conductor temperature, at the point z in the cable route ($^{\circ}\text{C}$);

$\theta_s(z)$ is the temperature of the cable surface, at the point z in the cable route ($^{\circ}\text{C}$);

T_1 is the thermal resistance per core between conductor and sheath ($\text{K}\cdot\text{m}/\text{W}$);

T_2 is the thermal resistance between sheath and armour ($\text{K}\cdot\text{m}/\text{W}$);

T_3 is the thermal resistance of external serving ($\text{K}\cdot\text{m}/\text{W}$).

The loss coefficients and thermal resistances are defined in IEC 60287-1-1 and IEC 60287-2-1.

4.2.3 Heat transfer by radiation from the cable surface to the inner wall of the tunnel

This heat transfer is modelled by Ohm's thermal law, characterized by a thermal resistance:

$$T_{st} = \frac{1}{\pi \cdot D_e^* \cdot K_t \cdot K_r \cdot \sigma_b \cdot [(\theta_s(L) + 273)^2 + (\theta_t(L) + 273)^2]} \cdot \frac{1}{[(\theta_s(L) + 273) + (\theta_t(L) + 273)]} \quad (4)$$

where

D_e^* is the cable diameter (m);

σ_b is Stefan-Boltzmann constant, $5,67 \times 10^{-8}$ (W/m²·K⁴);

$\theta_s(L)$ and $\theta_t(L)$ are the cable surface and tunnel surface temperatures at the tunnel outlet (°C);

K_t is the emissivity of the cable surface (typically 0,9 for served cable);

K_r is the radiation shape factor taking into account the radiation areas.

K_r may be expressed as:

$$K_r = \frac{1 - F_m}{1 - (1 - K_t) \cdot F_m}$$

where

F_m is a coefficient given in Table 1 and in Annex C

ITeH STANDARD PREVIEW

O: Outer cable	

4.2.4 Heat transfer by convection from the cable surface to the air inside the tunnel

The convective heat transfer from the cable surface to the air in the tunnel depends on the air flow characteristics, the velocity of the air being the leading parameter.

Where laminar air flow occurs, the convection thermal resistance is given by Formula (5):

$$T_{as} = \frac{1}{\left[\pi \cdot D_e^* \cdot h - \frac{1}{30^{0,25} \cdot T_{st}} \right] \cdot [\theta_s(L) - \theta_{at}(L)]^{0,25}} \tag{5}$$

where

h is the heat dissipation coefficient given in IEC 60287-2-1 for cables in still air (W/(m²·K^{5/4}));

θ_{at}(L) is the air temperature at the tunnel outlet (°C).

Formula (5) applies if the Reynolds number is less than 2 000.

If the Reynolds number is higher, the thermal resistance is first assumed to be given by Formula (6), valid for turbulent air flow.

$$T_{as} = \frac{1}{\pi \cdot k_{air} \cdot K_{cv} \cdot Re^{0,65}} \tag{6}$$

where

Re is the Reynolds number

$$Re = \frac{V \cdot D_e^*}{\nu}$$

iTeh STANDARD PREVIEW
(standards.iteh.ai)

ν is the kinematic viscosity for air (m²/s);

k_{air} is the thermal conductivity for air (W/(m·K));

V is the air velocity (m/s);

K_{cv} is an experimentally determined constant for which values are given in Table 2.

Table 2 – Value of parameter K_{cv}

Cable Arrangement	K _{cv}
Single cable	0,130
3 cables touching horizontally ^b	0,086
3 cables spaced horizontally ^a	0,115
3 cables touching vertically ^b	0,086
3 cables spaced vertically ^a	0,115
3 cables touching in trefoil	0,070
^a to be used where the spacing is larger than 2 x D _e [*]	
^b to be used where the spacing is smaller or equal to 2 x D _e [*]	

The values from Formulae (5) and (6) are compared and the higher of the two values is used.

4.2.5 Heat transfer by convection from the air inside the tunnel to the inner tunnel wall

This transfer is modelled by Ohm's thermal law, characterized by a thermal resistance:

If the Reynolds number is greater than 2 500, the air flow is assumed turbulent and the following relationship applies:

$$T_{\text{at}} = \frac{1}{\pi \cdot k_{\text{air}} \cdot 0,023 \cdot \text{Re}^{0,8} \cdot \text{Pr}^{0,4}} \quad (7)$$

where

Re is the Reynolds number

$$\text{Re} = \frac{V \cdot D_t}{\nu}$$

Pr is the Prandtl number

$$\text{Pr} = C_{\text{vair}} \cdot \frac{\nu}{k_{\text{air}}}$$

C_{vair} is the specific heat of air per unit volume (J/(m³·K));

D_t is the inner diameter of the tunnel (m).

If the Reynolds number is less than 2 500, the thermal resistance is considered negligible.

4.2.6 Longitudinal heat transfer by convection resulting from the forced or natural flow of air along the tunnel

The heat removed by the air, $W_a(z)$, is linked to the air temperature variations according to:

$$W_a(z) = C_{\text{av}} \cdot \frac{\partial \theta_{\text{at}}(z)}{\partial z} \quad (8)$$

where

C_{av} is the heat capacity of the air flow (W/K)

$$C_{\text{av}} = C_{\text{vair}} \cdot V \cdot A_t \quad (9)$$

A_t is the inner tunnel cross-sectional area (m²).

4.2.7 Radial heat conduction in the soil surrounding the tunnel

For circular tunnels the thermal resistance of the surrounding soil is expressed by:

$$T_e = \frac{\rho_{\text{soil}}}{2 \cdot \pi} \cdot \ln \left[u + \sqrt{u^2 - 1} \right] \quad (10)$$

where

$$u = \frac{2 \cdot L_t}{D_t}$$

ρ_{soil} is the soil thermal resistivity (K·m/W);

L_t is the depth of the tunnel axis (m).

For rectangular tunnels the thermal resistance of the surrounding soil is expressed by:

$$T_e = \frac{\rho_{\text{soil}}}{2 \cdot \pi} \cdot \ln \left[3,388 \cdot \frac{L_t}{\sqrt{A_t}} \right] \quad (11)$$
