About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

IEC Catalogue - webstore.iec.ch/catalogue

The stand-alone application for consulting the entire bibliographical information on IEC International Standards, Technical Specifications, Technical Reports and other documents. Available for PC, Mac OS, Android Tablets and iPad.

IEC publications search - www.iec.ch/searchpub

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and also once a month by email.

Electropedia - www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing 20 000 terms and definitions in English and French, with equivalent terms in 16 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

65 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**PHOTOVOLTAIC MODULES – BYPASS DIODE
ELECTROSTATIC DISCHARGE SUSCEPTIBILITY TESTING**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

The main task of IEC technical committees is to prepare International Standards. In exceptional circumstances, a technical committee may propose the publication of a technical specification when

- the required support cannot be obtained for the publication of an International Standard, despite repeated efforts, or
- the subject is still under technical development or where, for any other reason, there is the future but no immediate possibility of an agreement on an International Standard.

Technical specifications are subject to review within three years of publication to decide whether they can be transformed into International Standards.

IEC TS 62916, which is a technical specification, has been prepared by IEC technical committee 82: Solar photovoltaic systems.

The text of this technical specification is based on the following documents:

Enquiry draft	Report on voting
82/1059/DTS	82/1259/RVDTS

Full information on the voting for the approval of this technical specification can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC website under "http://webstore.iec.ch" in the data related to the specific publication. At this date, the publication will be

- transformed into an International standard,
- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

iTeh STANDARD PREVIEW

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

PHOTOVOLTAIC MODULES – BYPASS DIODE ELECTROSTATIC DISCHARGE SUSCEPTIBILITY TESTING

1 Scope

This document describes a discrete component bypass diode electrostatic discharge (ESD) immunity test and data analysis method. The test method described subjects a bypass diode to a progressive ESD stress test and the analysis method provides a means for analyzing and extrapolating the resulting failures using the two-parameter Weibull distribution function.

It is the object of this document to establish a common and reproducible test method for determining diode surge voltage tolerance consistent with an ESD event during the manufacturing, packaging, transportation or installation processes of PV modules.

This document does not purport to address causes of electrostatic discharge or to establish pass or fail levels for bypass diode devices. It is the responsibility of the user to assess the ESD exposure level for their particular circumstances. The data generated by this procedure may support qualification of new design types, quality control for incoming material, and/or identify the need for additional ESD controls in the manufacturing process.

Finally, this document does not apply to large energy surge events such as direct or indirect lightning exposure, utility capacitor bank switching events, or the like.

3 Terms, definitions and abbreviated terms

For the purposes of this document, the terms and definitions of IEC TS 61836 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1 DUT

device under test

3.2 contact discharge method

method of testing in which the electrode of the test generator is kept in contact with the DUT and the discharge is actuated by the discharge within the generator

Note 1 to entry: In this document, the contact is to the electrical lead of the DUT with no intervening electrical insulation material.

3.3

diode check function

usage of a multimeter with diode function check to verify the diode is functional, short or open

3.4

direct application

application of the test surge directly to the DUT

Note 1 to entry: In this technical specification, the surges are directed to bypass diodes for photovoltaic applications outside of the actual photovoltaic application (e.g., DUT are tested outside of the junction box and are not associated with the photovoltaic module itself when characterized).

3.5

surge relaxation time

amount of time necessary for the DUT to thermally stabilize in the event that surge application creates localized regions of heat generation

4 General

Production line quality excursions due to bypass diode failure have been observed in the PV module manufacturing process due to changes in the electrostatic discharge (ESD) susceptibility of bypass diodes. This document provides a method to evaluate the susceptibility of bypass diodes to fail due to ESD events that may occur in the production, transport or installation of photovoltaic (PV) modules. ESD events occur whenever there is contact, or sufficiently close proximity between objects of different electrostatic charge. The magnitude of the ESD event is a function of the charge difference between the objects and the impedance associated with the charge transfer. Of specific interest in this document are relatively low energy, short-duration surges that may be associated with the manufacturing process, testing, or installation events where the bypass diodes are directly exposed to an ESD event.

Several standard ESD models exist for the evaluation of surge immunity. This document adopts the model provided by IEC 61000-4-2:2008 that provides a method for assessing damage to electrical and electronic equipment subjected to static electricity discharges from operators directly, and from personnel to adjacent objects.

5 Sampling

Ten unconditioned diodes are required for this test. Several factors should be considered when making sample selection:

- Diode types shall be identical. Different diode types will not provide useful surge immunity information.
 - Each diode type that was tested during the development of this procedure yielded a different failure distribution indicating that mixed type testing would not be meaningful.
- Diode date codes and factory location should be identical.
 - The best characterization of a diode's surge immunity will be obtained when the diodes are from one manufacturing location and from a specific manufacturing batch.
 - Comparison of the failure distributions that result from applying this procedure to several different date codes may provide the user with a qualitative understanding of the diode manufacturer's quality control from a surge immunity perspective. Similarity of results from different date codes would indicate a tighter quality control method.
- Diodes are tested independently and outside of a module or junction box. The leads shall be in the form required before assembly into a junction box.

- Lead trimming or lead forming operations should be done before testing as these operations can create stress on the diode die that may have an impact on the diode's surge immunity.

6 Test equipment

Test equipment shall conform to the requirements stated in IEC 61000-4-2:2008, Clause 6 using the discharge electrode for contact discharges. The discharge return connection from the surge generator shall be connected to a grounding block designed to accommodate the DUT samples, taking into account spacing requirements that may be required for formed leads as shown in Figure 1. Multiple DUT samples may be connected to a single grounding block.

The equipment shall be capable of positive polarity surges (with respect to earth ground), conducted in a single-surge mode, and with a voltage that can be incremented in 5 kV steps from 5 kV to a recommended 30 kV or higher capability. Equipment having a surge voltage limitation that is less than 30 kV may be used, but this may limit DUT failure information and subsequent data analysis for a very surge-resistant DUT.

Figure 1 – Example of a test setup for bypass diodes

7 Test method

7.1 Preparation

- Place 10 unconditioned DUTs into an electrically grounded fixture such that the DUT anode is grounded and the cathode is exposed and accessible (Figure 1).
- Use a multimeter with diode-check functionality to verify that all DUTs are functional in the forward bias direction and that none are shorted in the reverse bias direction. In the event that a DUT is found to be in a non-operational state before test, replace as necessary so that ten functional units are subjected to the surge testing.
