About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

IEC Catalogue - webstore.iec.ch/catalogue

The stand-alone application for consulting the entire bibliographical information on IEC International Standards, Technical Specifications, Technical Reports and other documents. Available for PC, Mac OS, Android Tablets and iPad.

IEC publications search - www.iec.ch/searchpub

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and also once a month by email.

Electropedia - www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing 20 000 terms and definitions in English and French, with equivalent terms in 15 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

65 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: csc@iec.ch.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

MAGNETIC MATERIALS –**Part 1: Classification****FOREWORD**

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as “IEC Publication(s)”). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

This redline version of the official IEC Standard allows the user to identify the changes made to the previous edition. A vertical bar appears in the margin wherever a change has been made. Additions are in green text, deletions are in strikethrough red text.

International Standard IEC 60404-1 has been prepared by IEC technical committee 68: Magnetic alloys and steels.

This third edition cancels and replaces the second edition published in 2000 and constitutes a technical revision.

This edition includes the following significant technical changes with respect to the previous edition:

- a) Removal of all tables and values describing typical properties of the material to be consistent with the aim of the document to be a classification and not a specification.
- b) Enlargement of the Ni content for the classes E1 and E3.
- c) Enlargement of the Co content for the classes F3.
- d) Addition of a new class: U5 bonded rare earth-iron-nitrogen magnets.

The text of this standard is based on the following documents:

CDV	Report on voting
68/533/CDV	68/555/RVC

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 60404 series, published under the general title *Magnetic materials*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

IMPORTANT – The “colour inside” logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this publication using a colour printer.

MAGNETIC MATERIALS –

Part 1: Classification

~~1~~ **General**

1 ~~Scope and object~~

This part of IEC 60404 is intended to classify commercially available magnetic materials.

The term "magnetic materials" denotes substances where the application requires the existence of ferromagnetic or ferrimagnetic properties.

In this document, the classification of magnetic materials is based upon the generally recognized existence of two main groups of products:

- soft magnetic materials (coercivity $\leq 1\ 000$ A/m);
- hard magnetic materials (coercivity $> 1\ 000$ A/m).

Within these main groups, the classification when appropriate recognizes the following characteristics:

- the main alloying element and the metallurgical state and physical properties of the material;
- when possible and convenient, the relationship between these characteristics is identified.

A classification by specific areas of application cannot be applied to all materials because different materials can very often be used for the same application depending on the characteristics required.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document, the terms and definitions ~~relating to the various terms used in this part of IEC 60404 are defined~~ given in IEC 60050-121, IEC 60050-151, IEC 60050-221 and in the product standards of the IEC 60404-8 series apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

4 Magnetically soft materials (coercivity ≤ 1 kA/m)

4.1 Class A – Irons

4.1.1 General Reference documents

These materials are covered by IEC 60404-8-6 and IEC 60404-8-10.

4.1.2 Chemical composition

The basic constituent of these materials is pure iron, and they are often referred to as "commercially pure" or "magnetically soft" irons. ~~The material also contains unavoidable impurities that may affect magnetic properties.~~ ~~Elements~~ The amount of impurities that adversely affect the remanence, coercivity, saturation, magnetic polarization and stability of the magnetic properties are ~~controlled~~ limited to produce the required magnetic properties for the proposed application. ~~The amounts of the most significant elements, other than iron, when they are present in these materials are characteristically within the ranges of table 1.~~

Table 1 – Ranges of chemical composition

C %	Si %	Mn %	P %	S %	Al %	Ti %	V %
Up to 0,03	Up to 0,1	0,03 to 0,2	Up to 0,015*	Up to 0,03*	Up to 0,08	Up to 0,1	Up to 0,1
* For improved free machining capability, the upper limits for P and S may be higher than indicated in the table.							

For information the most significant impurities when they are present in these materials are carbon (up to 0,03 %), silicon (up to 0,1 %), manganese (up to 0,2 %), phosphorus (up to 0,015 %), sulphur (up to 0,03 %), aluminium (up to 0,08 %), titanium (up to 0,1 %) and vanadium (up to 0,1 %).

NOTE For improved free machining capability, the amount of phosphorus and sulphur can be higher than indicated above.

4.1.3 Basis of subclassification

The recommended subclassification is based on coercivity values.

4.1.4 Available forms

These materials are available in a wide variety of forms. They may be supplied as slabs, billets, ingots or forgings; as hot-rolled bar in rectangular and square cross-sections; as hot-rolled wire rod in round, hexagonal and octagonal cross-sections; in cold-rolled and drawn forms as bar and wire; as hot- or cold-rolled sheet and strip.

4.1.5 Physical characteristics

In addition to the values of coercivity, a more complete definition of these materials can be based on the following characteristics:

- magnetic: saturation magnetic polarization, magnetic polarization ~~for~~ at various values of magnetic field strengths (from which permeability can be derived), stability of characteristics with time;
- mechanical: hardness, suitability for punching operations, free machining capability, deep drawing properties, tensile strength;
- metallurgical state: hot- or cold-worked, forged, deep drawn, fully processed state, i.e. final annealed.

NOTE For material not delivered in the fully processed state, subclassification is based on the coercivity measured after heat treatment according to the requirements of the product standard or the recommendations of the manufacturer.

Ranges of specified values for the above-mentioned magnetic characteristics in the fully processed state are ~~as shown in table 2~~ given in the corresponding product specifications.

Table 2 – Ranges of specified values for magnetic properties

Maximum coercivity	Minimum magnetic polarization for $H =$			Minimum saturation magnetic polarization*
	300 A/m	500 A/m	4 000 A/m	
A/m	⌈	⌈	⌈	⌈
12 to 240	1,30 to 1,15	1,40 to 1,30	1,60	2,10 to 2,16
* Value not specified but typical.				

4.1.6 Main applications

The main applications are in DC relays, loudspeakers, electromagnets, magnetic clutches, brakes, parts for magnetic circuits in instruments and control apparatus, as well as for pole pieces and other DC parts for generators and motors.

4.2 Class B – Low carbon mild steels

4.2.1 Class B1 – Bulk material

4.2.1.1 General Reference document

Some of these materials are covered by IEC 60404-8-10.

4.2.1.2 Chemical composition

The basic constituent of these materials is iron containing unavoidable impurities, together with a low level of other elements which may arise from additions necessitated during the manufacturing process. The amount of alloying elements is limited to that of a non-alloy steel as defined in ISO 4948-1, in particular silicon is less than 0,5 %.

4.2.1.3 Basis of subclassification

The recommended subclassification is based on the coercivity.

4.2.1.4 Available forms

These materials are normally supplied in the form of castings or forgings in a final heat-treated condition or partially machined to drawings supplied by the user or as bar, wire rod or wire in the hot-rolled, cold-rolled or cold-drawn condition.

4.2.1.5 Physical characteristics

In addition to the coercivity a more complete definition of these materials can be based on the following properties:

- magnetic: magnetic polarization at various values of magnetic field strength;
- mechanical: yield strength (or 0,2 % proof stress) elongation ($L_0 = 5 d_0$), freedom from defects;
- metallurgical state: hot- or cold-worked, annealed to produce required magnetic characteristics.

Mechanical and non-destructive tests are made in accordance with the appropriate ISO standards. Coercivity shall be measured in accordance with IEC 60404-7, other magnetic properties in accordance with IEC 60404-4.

Ranges of typical values of magnetic and mechanical properties are given in ~~table 3~~ the corresponding product specification.

Table 3 — Ranges of typical values of magnetic and mechanical properties

Yield strength	Elongation ($L_0 = 5 d_0$)	Coercivity	Magnetic polarization at $\mu =$		
			2 500 A/m	5 000 A/m	10 000 A/m
N/mm ²	%	A/m	T		
100 to 180	25 to 45	40 to 400	1,65 to 1,55	1,75 to 1,65	1,85 to 1,75

4.2.1.6 Main applications

The materials are used for large DC magnets where no mechanical strength is required, for example, in deflection magnets in elementary particle physics and for relay applications.

4.2.2 Class B2 – Flat material [IEC 60404-1:2016](https://standards.iteh.ai/catalog/standards/iec/74a5c59e-47bd-4ec6-8e61-d8848ce64277/iec-60404-1-2016)

4.2.2.1 General Reference documents

These materials are covered by IEC 60404-8-3, IEC 60404-8-4 and IEC 60404-8-10.

4.2.2.2 Chemical composition

The basic constituent of these materials is iron containing unavoidable impurities, together with a low level of other elements which may arise from additions necessitated during the manufacturing process. The amount of alloying elements is limited to that of non-alloy steel as defined in ISO 4948-1, in particular silicon is less than 0,5 %. These materials can have an annealing treatment after punching to enhance their magnetic properties.

4.2.2.3 Basis of subclassification

The recommended subclassification is based either on the specific total loss which is a function of thickness and is normally measured at a magnetic polarization value of 1,5 T and at normal industrial power frequencies or (for relay application) on the coercivity.

4.2.2.4 Available forms

These materials are supplied in the form of cold-rolled coils or sheets or (for relay application) in the form of hot-rolled strip, sheet or plate.

4.2.2.5 Physical characteristics

In addition to specific total loss, a more complete definition of these materials can be based on the following properties:

- magnetic: magnetic polarization at various values of magnetic field strength;
- mechanical: suitability for punching operations, surface condition, stacking factor;
- metallurgical state: hot-rolled; hard state – i.e. cold-rolled; semi-processed state – i.e. annealed and finally cold-rolled; fully processed state – i.e. final annealed.

NOTE For material delivered in the hard or semi-processed state, subclassification is based on the total specific loss or coercivity measured after heat treatment according to the requirements of the product standard or recommendations of the manufacturer.

- dimensions: thickness, width and (as required) length.

Recommended nominal thicknesses for the cold-rolled materials are ~~0,47 mm, 0,50 mm, 0,65 mm and 1,0 mm~~ given in the corresponding product specifications.

Magnetic measurements are made in accordance with IEC 60404-2, IEC 60404-3 or IEC 60404-7.

Ranges of specified values of maximum specific total loss, after annealing, for the commonly used thicknesses are also shown in ~~table 4~~ the corresponding product specifications.

~~Table 4 – Ranges of specified values of maximum specific total loss~~

Nominal thickness	Frequency	Ranges of specific total loss at $J = 1,5 \text{ T}$
mm	Hz	W/kg
0,50	50	6,6 to 10,5
0,65	50	8,0 to 12,0
0,50	60	8,4 to 13,4
0,65	60	10,2 to 15,3

The specified maximum value of coercivity for relay material ranges from 40 A/m to 240 A/m.

4.2.2.6 Main applications

The materials are used in the manufacture of laminated cores for electrical apparatus and especially small machines and for relay applications.

4.3 Class C – Silicon steels

4.3.1 Class C1 – Bulk material

4.3.1.1 General Reference documents

Some of these materials are covered by IEC 60404-8-6 and IEC 60404-8-10.

4.3.1.2 Chemical composition

The basic constituent of these materials is iron in which the main alloying element is silicon ~~in the range of 0,5 %~~ with a content of up to approximately 5 %.

4.3.1.3 Basis of subclassification
